NIP : 19770218 200501 2 002

Abstrak

Berkembangnya perekonomian berbanding lurus dengan meningkatnya volume kendaraan lalu lintas di daerah Surabaya, sehingga pemerintah kota Surabaya merencanakan perbaikan manajemen lalu lintas. Seperti di daerah Rungkut Surabaya saat ini sedang diadakan proyek pelebaran jalan dengan pemasangan box culvert di Jl. Zamhuri untuk mengurangi kemacetan. Dengan selesainya proyek tersebut, kemungkinan akan menyebabkan bertambahnya volume lalu lintas pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya. Oleh karena itu, perlu dilakukan analisa dan evaluasi kinerja pada simpang serta perencanaan perbaikan simpang agar kinerja persimpangan dapat dioptimalkan sesuai rencana.

Analisa kinerja persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya untuk saat ini (tahun 2017) sampai dengan 5 tahun mendatang (2018 - 2022) diawali dari pengumpulan data-data jumlah penduduk, tata guna lahan, dan pertumbuhan jumlah kendaraan yang didapat dari BPS Kota Surabaya dan PU Cipta Karya Kota Surabaya sebagai data sekunder. Kemudian melakukan survey volume lalu lintas di persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri

Kidul Surabaya untuk mendapatkan data primer. Setelah semua data tersebut terkumpul, dilanjutkan dengan mengolah data secara manual berdasarkan MKJI 1997 dan menggunakan program KAJI.

Berdasarkan hasil analisa dan evaluasi kinerja simpang kondisi eksisting berupa simpang tak bersinyal pada Puncak Pagi, Puncak Siang, dan Puncak Sore didapatkan $DS > 0,75$ dengan Peluang antrian (QP) berkisar $|29 \% - 179 \%| > 100 \%$. Dilakukan perencanaan perbaikan kinerja simpang alternative 1 dengan merencanakan pengaturan simpang bersinyal 3 fase pelebaran jalan, serta mengurangi hambatan samping menjadi kategori sedang. Pada Puncak Pagi, Puncak Siang, dan Puncak Sore tahun 2017 - 2022 diperoleh rata-rata $DS < 0,75$ dengan Tundaan Simping Rata-Rata (DI) berkisar $|26,58 - 39,07|$ det/smp dan didapatkan rata-rata LOS D. Kemudian dilakukan perencanaan perbaikan kinerja simpang alternative 2 sebagai alternative perbaikan terpilih yaitu dengan pelebaran jalan, perubahan fase, serta penyesuaian waktu sinyal. Pada Puncak Pagi, Puncak Siang, dan Puncak Sore tahun 2017 - 2022 diperoleh rata-rata $DS < 0,75$ dengan Tundaan Simping Rata-Rata (DI) berkisar $|22,28 - 35,79|$ det/smp dan didapatkan rata-rata LOS C.

Kata Kunci : Simping Tak Bersinyal, MKJI 1997, KAJI, Simping Bersinyal

**PERFORMANCE EVALUATION OF UNSIGNALLED
INTERSECTION ON RUNGKUT KIDUL STREET –
ZAMHURI STREET – RUNGKUT TENGAH STREET –
RUNGKUT INDUSTRI KIDUL STREET SURABAYA**

Abstract

The development of economy are equal to the increase of volume traffic in Surabaya, so Surabaya's government are planning the improvement and development of traffic management. For example, Rungkut Surabaya which currently held road widening project with box culvert's installation at Zamhuri Street to reduce it's traffic jam. With the completion of the project, it's likely to cause an increase in traffic volume at the intersection of Rungkut Kidul Street – Zamhuri Street – Rungkut Tengah Street – Rungkut Industri Kidul Street Surabaya. Therefore, it's necessary to analyze and evaluate the performance at the intersection and planning the improvement of the intersection so it can be optimized according to plan.

Performance analysis the intersection of Rungkut Kidul Street – Zamhuri Street – Rungkut Tengah Street – Rungkut Industri Kidul Street Surabaya starting in this year (2017) up to the next 5 years (2018 – 2022). This analysis start with data collection of population data, land use, and growth of vehicles obtained from BPS and PU Cipta Karya Surabaya as secondary data. Then survey data of vehicle volume in intersection area as primary data. After all data collected, then manually analysis data based on MKJI 1997 and using KAJI program.

Based on the analysis and performance evaluation of existing unsignaled intersection at peak hour in the morning, afternoon, and evening can be inferred $DS > 0,75$ and QP about $|29 \% - 179 \%| > 100\%$. Then planning alternative repairs, the first alternative is planning signaled intersection with a 3-phase, widening the approach, and reduce the side friction to median category. At peak hour in the morning, afternoon, and evening in 2017 – 2022 obtained average of $DS < 0,75$ with range of Delay Intersection (DI) about $|26,58 - 39,07|$ sec/pcu and average LOS D. The second alternative as the selected alternative is widening the approach, changes the phase, and adjust the cycle time. At peak hour in the morning, afternoon, and evening in 2017 – 2022 obtained average of $DS < 0,75$ with range of Delay Intersection (DI) about $|22,28 - 35,79|$ sec/pcu and average LOS C.

Keywords : Unsignalised Intersection, MKJI 1997, KAJI, Signalised Intersection

KATA PENGANTAR

Segala puji syukur penulis panjatkan kepada Tuhan yang Maha Esa yang telah melimpahkan rahmat dan anugerah-Nya sehingga Tugas Akhir Terapan yang berjudul "*EVALUASI KINERJA SIMPANG TAK BERSINYAL JL. RUNGKUT KIDUL – JL. ZAMHURI – JL. RUNGKUT TENGAH – JL. RUNGKUT INDUSTRI KIDUL SURABAYA*" dapat terselesaikan dengan baik dan penulis dapat mempresentasikan pada Sidang Tugas Akhir.

Tugas Akhir Terapan merupakan salah satu syarat akademis yang harus ditempuh mahasiswa untuk menyelesaikan pendidikan pada Program Studi Diploma III Departemen Teknik Infrastruktur Sipil Institut Teknologi Sepuluh Nopember Surabaya.

Ucapan terima kasih disampaikan kepada pihak-pihak yang telah banyak membantu dan mendukung penulis dalam menyelesaikan Tugas Akhir Terapan, yaitu :

1. Ibu Amalia Firdaus M., ST, MT selaku dosen pembimbing Tugas Akhir Terapan.
2. Orang tua dan keluarga yang telah memberikan dukungan moril dan material, sehingga penulis mampu menyelesaikan Tugas Akhir Terapan ini.
3. Semua pihak dan instansi yang telah membantu dan memberikan dukungan dalam penyusunan Tugas Akhir Terapan.

Semoga Tugas Akhir Terapan ini bermanfaat bagi penulis maupun pembaca pada umumnya. Tugas akhir Terapan ini tentunya jauh dari kesempurnaan, oleh karena itu penulis mengharapkan adanya kritik maupun saran yang membangun dari semua pihak. Terima kasih.

Surabaya, Juli 2017

BAB I

PENDAHULUAN

1.1 Latar Belakang

Kota Surabaya merupakan salah satu pusat kegiatan perekonomian di Jawa Timur. Untuk itu, pemerintah kota Surabaya terus melakukan pembangunan untuk meningkatkan perekonomian masyarakat supaya menjadi baik. Pembangunan tersebut meliputi segala aspek, baik dalam bidang komersil, perumahan, pendidikan, dan sebagainya.

Berkembangnya perekonomian berbanding lurus dengan meningkatnya volume kendaraan lalu lintas di daerah Surabaya, sehingga pemerintah kota Surabaya merencanakan perbaikan dan pengembangan manajemen lalu lintas. Seperti di daerah Rungkut Surabaya saat ini sedang diadakan proyek pelebaran jalan dengan pemasangan box culvert di Jl. Zamhuri untuk mengurangi kemacetan. Persimpangan yang secara langsung terpengaruh akibat pemasangan box culvert tersebut ialah simpang empat di Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya.

Dari permasalahan diatas dapat disimpulkan akan menyebabkan bertambahnya volume lalu lintas pada persimpangan, sehingga perlu adanya analisa dan evaluasi kinerja persimpangan baik dari manajemen lalu lintas, pengaturan waktu *traffic light*, dan kondisi eksisting persimpangan saat proyek pemasangan box culvert sudah selesai. Diharapkan dapat memberikan pemikiran penanggulangan masalah yang ada di persimpangan ini.

1.2 Rumusan Masalah

Berdasarkan kondisi tersebut dapat dirumuskan permasalahan yang terjadi pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya sebagai berikut :

1. Bagaimana kinerja persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya yang berupa simpang tak bersinyal?
2. Apakah dengan menggunakan manajemen lalu lintas simpang tak bersinyal masih layak dipertahankan?
3. Bagaimana mengevaluasi kinerja persimpangan tersebut pada kondisi saat ini (tahun 2017) untuk menjadi lebih baik setelah selesai pemasangan box culvert?

1.3 Tujuan Penulisan

Studi ini dilakukan dengan maksud mengetahui permasalahan yang timbul karena tidak optimalnya persimpangan pada Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya dan memberikan solusi penanggulangan masalah yang ada di persimpangan ini.

Berdasarkan perumusan masalah di atas, maka tujuan penulisan Tugas Akhir Terapan ini yang dipengaruhi oleh adanya perubahan kinerja persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya adalah sebagai berikut :

1. Untuk mengetahui kinerja persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya (kapasitas, derajat kejenuhan, dan peluang antrian) yang terjadi berdasarkan volume lalu lintas yang berupa simpang tak bersinyal.
2. Untuk mengetahui kelayakan simpang dengan kondisi manajemen lalu lintas berupa simpang tak bersinyal.
3. Mengevaluasi dan merencanakan alternative perbaikan kinerja persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya agar menjadi lebih baik setelah pemasangan box culvert untuk saat ini (tahun 2017) maupun untuk jangka waktu 5 tahun ke depan (2018-2022) berdasarkan MKJI 1997.

1.4 Batasan Masalah

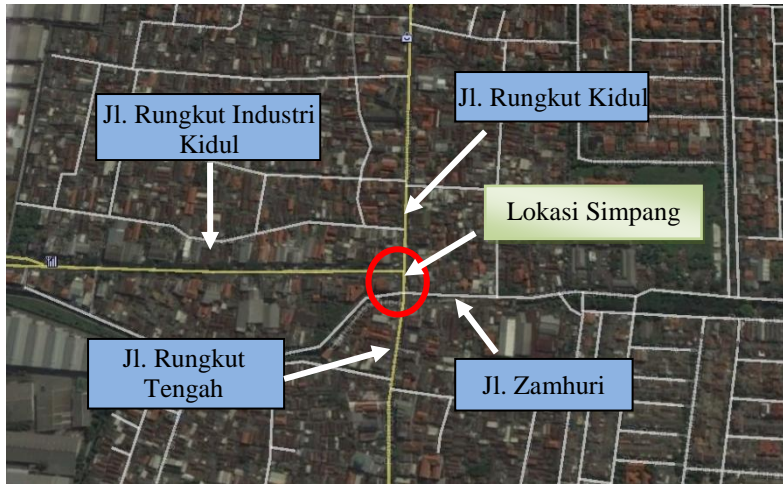

Agar tidak terjadi penyimpangan pembahasan permasalahan dan topik yang diambil, maka batasan permasalahan pada penyusunan Tugas Akhir Terapan ini meliputi :

1. Mengevaluasi kinerja simpang Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya yang berupa simpang tak bersinyal.
2. Mengevaluasi kinerja simpang tak bersinyal, apabila sudah tidak layak maka dilakukan perubahan menjadi simpang bersinyal.
3. Dasar teori dan teknis dalam menganalisa dan mengevaluasi kinerja persimpangan hanya berdasarkan syarat teknis simpang tak bersinyal dan simpang bersinyal menurut MKJI 1997.
4. Periode evaluasi kinerja simpang tak bersinyal tahun 2017, lalu perencanaan perbaikan menjadi simpang bersinyal dari tahun 2017 sampai 5 tahun kedepan (tahun 2022).

1.5 Manfaat Penulisan

Manfaat dari penulisan Tugas Akhir Terapan ini adalah mengetahui dan merencanakan alternative perbaikan kinerja persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya. Diharapkan dapat meminimalkan permasalahan kemacetan, dan memperlancar lalu lintas sesuai dengan yang telah direncanakan.

1.6 Denah Lokasi Studi

BAB II

TINJAUAN PUSTAKA

2.1 Landasan Teori MKJI (Manual Kapasitas Jalan Indonesia) 1997

Manual Kapasitas Jalan Indonesia 1997 mencakup fasilitas jalan perkotaan, semi perkotaan, jalan luar kota, dan jalan bebas hambatan. Manual ini menggantikan manual sementara untuk fasilitas lalu-lintas perkotaan (Januari 1993) dan jalan luar kota (Agustus 1994) yang telah diterbitkan lebih dahulu dalam proyek MKJI. Tipe fasilitas yang tercakup dan ukuran penampilan lalu-lintas selanjutnya disebut perilaku lalu-lintas atau kualitas lalu-lintas.

Tujuan analisa MKJI adalah untuk dapat melaksanakan Perancangan (planning), Perencanaan (design), dan Pengoperasionalan lalu-lintas (traffic operation) simpang bersinyal, simpang tak bersinyal dan bagian jalinan dan bundaran, ruas jalan (jalan perkotaan, jalan luar kota dan jalan bebas hambatan).

Manual ini direncanakan terutama agar pengguna dapat memperkirakan perilaku lalu-lintas dari suatu fasilitas pada kondisi lalu-lintas, geometrik dan keadaan lingkungan tertentu. Nilai-nilai perkiraan dapat diusulkan apabila data yang diperlukan tidak tersedia. Terdapat tiga macam analisis, yaitu :

1. Analisa Perancangan (planning), yaitu :

Analisa terhadap penentuan denah dan rencana awal yang sesuai dari suatu fasilitas jalan yang baru berdasarkan ramalan arus lalu-lintas.

2. Analisa Perencanaan (design), yaitu :

Analisa terhadap penentuan rencana geometrik detail dan parameter pengontrol lalu-lintas dari suatu fasilitas jalan baru atau yang ditingkatkan berdasarkan kebutuhan arus lalu-lintas yang diketahui.

3. Analisa Operasional

Analisa terhadap penentuan perilaku lalu-lintas suatu jalan pada kebutuhan lalu-lintas tertentu. Analisa terhadap penentuan waktu sinyal untuk tundaan terkecil. Analisa peramalan yang akan terjadi akibat adanya perubahan kecil pada geometrik, arus lalu-lintas dan kontrol sinyal yang digunakan.

Dengan melakukan perhitungan bersambung yang menggunakan data yang disesuaikan, untuk keadaan lalu-lintas dan lingkungan tertentu dapat ditentukan suatu rencana geometrik yang menghasilkan perilaku lalu-lintas yang dapat diterima. Dengan cara yang sama, penurunan kinerja dari suatu fasilitas lalu-lintas sebagai akibat dari pertumbuhan lalu-lintas dapat dianalisa, sehingga waktu yang diperlukan untuk tindakan turutan seperti peningkatan kapasitas dapat juga ditentukan.

2.2 Prosedur Perhitungan Simpang Tak Bersinyal

2.2.1 Definisi

Definisi simpang tak bersinyal adalah simpang dengan tiga atau empat lengan tanpa sinyal lalu lintas, yang perauran prioritasnya diberikan kepada kendaraan yang datang dari arah kiri pengemudi.

2.2.2 Kapasitas

Kapasitas Total Kapasitas total untuk seluruh lengan simpang adalah hasil perkalian antara kapasitas dasar (C_0) yaitu kapasitas pada kondisi tertentu (ideal) dan faktor-faktor penyesuaian (F), dengan memperhitungkan pengaruh kondisi lapangan terhadap kapasitas.

Bentuk model kapasitas total (C) sebagai berikut :

$$C = C_0 \times F_W \times F_M \times F_{CS} \times F_{RSU} \times F_{LT} \times F_{RT} \times F_{MI} \dots (2.1)$$

Dalam memperkirakan kapasitas (smp/jam), variable-variabel masukan yang digunakan model diatas yaitu :

Tabel 2.1 Ringkasan Variabel-Variabel Masukkan Model Kapasitas.

| Type Variabel | Uraian variabel dan nama masukkan | | Faktor model |
|----------------------|--|------------------|---|
| Geometri | Tipe Simpang | IT | F_W |
| Lingkungan | Lebar rata-rata pendekat | W_I | |
| | Tipe median jalan utama | M | |
| Lalu-lintas | Kelas ukuran kota | CS | F_{CS} |
| | Tipe lingkungan jalan | RE | F_{RSU} F_{LT} F_{RT} F_{MI} |
| | Hambatan samping | SF | |
| | Rasio kendaraan tak bermotor | P_{UM} | |
| | Rasio belok kiri | P_{LT} | |
| | Rasio belok kanan | P_{RT} | |
| | Rasio arus jalan minor | Q_{MI}/q_{TOT} | |

Sumber : MKJI 1997

2.2.3 Derajat Kejenuhan

Derajat kejenuhan untuk seluruh simpang, (DS), dihitung sebagai berikut:

$$DS = Q_{smp}/C \quad \dots\dots\dots (2.2)$$

Dimana :

Q_{smp} = Arus total (smp/jam) dihitung sebagai berikut :

$$Q_{smp} = Q_{kend} \times F_{smp}$$

F_{smp} = Faktor smp, dihitung sebagai berikut :

$$F_{smp} = (emp_{LV} \times LV\% + emp_{HV} \times HV\% + emp_{MC} \times MC\%) / 100$$

Dimana emp_{LV} , $LV\%$, emp_{HV} , emp_{MC} , $MC\%$ adalah emp dan komposisi lalu-lintas untuk kendaraan ringan, kendaraan berat dan sepeda motor.

C = Kapasitas (smp/jam).

2.2.4 Tundaan

Tundaan pada simpang dapat terjadi dua sebab, antara lain :

1. TUNDAAN LALU-LINTAS (DT) akibat interaksi lalu-lintas dengan gerakan yang lain dalam simpang.
2. TUNDAAN GEOMETRIK (DG) akibat perlambatan dan percepatan kendaraan yang terganggu dan tak terganggu.

Tundaan lalu-lintas seluruh simpang (DT), jalan minor (DT_{MI}) dan jalan utama (DT_{MA}), ditentukan dari kurva tundaan empiris dengan derajat kejenuhan sebagai variabel bebas.

Tundaan geometrik (DG) dihitung dengan rumus :

Untuk $DS < 1,0$

$$DG = (1-DS) \times (P_T \times 6 + (1-P_T) \times 3) + DS \times 4 \text{ (det/smp)}. \dots (2.3)$$

Untuk $DS \geq 1,0$: **DG = 4**

Dimana :

DS = Derajat kejenuhan

PT = Rasio arus belok terhadap arus total

6 = Tundaan geometrik normal untuk kendaraan belok yang tak terganggu (det/smp)

4 = Tundaan geometrik normal untuk kendaraan yang terganggu (det/smp)

2.2.5 Peluang Antrian

Peluang antrian ditentukan dari kurva peluang, antrian/derajat kejenuhan secara empiris.

2.2.6 Prosedur Perhitungan

2.2.6.1 Data Masukan

2.2.6.1.1 Kondisi Geometrik

Sketsa pola geometrik digambarkan pada Formulir USIG-I. Jalan utama adalah jalan yang dipertimbangkan terpenting pada simpang. Sketsa sebaiknya memberikan gambaran yang baik dari suatu simpang mengenai informasi tentang kerib, lebar jalur bahu dan median.

Gambar 2.1 Contoh Sketsa Data Masukan Geometrik

Sumber : MKJI 1997

2.2.6.1.2 Kondisi Lalu Lintas

Situasi lalu-lintas untuk tahun yang dianalisa ditentukan menurut Arus Jam Rencana, atau lalu-lintas Harian Rata-rata Tahunan (LHRT) dengan faktor yang sesuai untuk konversi dari LHRT menjadi arus per jam (umum untuk perancangan).

Sketsa arus lalu-lintas memberikan informasi lalu-lintas lebih rinci dari yang diperlukan untuk analisa simpang tak bersinyal. Jika alternatif pemasangan sinyal pada simpang juga akan diuji, informasi ini akan diperlukan. Sketsa sebaiknya menunjukkan gerakan lalu-lintas bermotor dan tak bermotor (kend/jam) pada pendekatan A_{LT} , A_{ST} , A_{RT} dan seterusnya.

Gambar 2.2 Contoh Sketsa Arus Lalu Lintas

Sumber : MKJI 1997

Perhitungan Arus Lalu Lintas Dalam Satuan Mobil Penumpang (SMP)

1. Data arus lalu-lintas klasifikasi per jam tersedia untuk masing-masing gerakan
 - Jika data arus lalu-lintas klasifikasi tersedia untuk masing-masing gerakan, data tersebut dapat dimasukkan pada Kolom 3, 5, 7 dalam satuan kend/jam. Arus total kend/jam untuk masing-masing gerakan lalu-lintas dimasukkan pada Kolom 9. Jika data arus kendaraan tak bermotor tersedia, angkanya dimasukkan kedalam Kolom 12.
 - Konversi ke dalam smp/jam dilakukan dengan mengalikan emp yang tercatat pada formulir (LV:1,0; HV:1,3; MC:0,5) dan catat hasilnya pada Kolom 4, 6 dan 8. Arus total dalam smp/jam untuk masing-masing gerakan lalu-lintas dimasukkan pada Kolom 10.
2. Data arus lalu-lintas per jam (bukan klasifikasi) tersedia, untuk masing-masing gerakan beserta informasi tentang komposisi lalu-lintas keseluruhan dalam %.
 - Masukkan arus lalu-lintas untuk masing-masing gerakan dalam kend/jam pada Kolom 9.

- Hitung faktor smp F_{smp} dari emp yang diberikan dan data komposisi arus lalu lintas kendaraan bermotor dan masukkan hasilnya pada Baris 1, Kolom 10:

$$F_{smp} = (\text{emp}_{LV} \times LV\% + \text{emp}_{HV} \times HV\% + \text{emp}_{MC} \times MC\%) / 100$$

- Hitung arus total dalam smp/jam untuk masing-masing gerakan dengan mengalikan arus dalam kend/jam (Kolom 9) dengan F_{smp} , dan masukkan hasilnya pada Kolom 10.

3. Data arus lalu-lintas hanya tersedia dalam LHRT (Lalu Lintas Harian Rata-rata Tahunan)

- Konversikan nilai arus lalu-lintas yang diberikan dalam LHRT melalui perkalian dengan faktor-k (tercatat pada Baris 1, kolom 12) dan masukkan hasilnya pada Kolom 9.

$$Q_{DH} = k \times LHRT$$

- Konversikan arus lalu-lintas dari kend/jam menjadi smp/jam melalui perkalian dengan faktor smp (F_{smp}) sebagaimana diuraikan di atas dan masukkan hasilnya pada Kolom 10.

Nilai Normal Variabel Umum Lalu Lintas

Data lalu-lintas sering tidak ada atau kualitasnya kurang baik. Nilai normal yang diberikan pada Tabel di bawah dapat digunakan untuk keperluan perancangan sampai data yang lebih baik tersedia.

Tabel 2.2 Nilai Normal Faktor-k

| Lingkungan jalan | Faktor-k-Ukuran kota | |
|--|----------------------|-----------|
| | > 1 juta | ≤ 1 juta |
| Jalan di daerah komersial dan jalan arteri | 0,07-0,08 | 0,08-0,10 |
| Jalan di daerah permukiman | 0,08-0,09 | 0,09-0,12 |

Sumber : MKJI 1997

Tabel 2.3 Nilai Normal Komposisi Lalu Lintas

| Ukuran kota Juta penduduk | Komposisi lalu-lintas kendaraan bermotor% | | | Rasio kendaran Tak bermotor (UM/MV) |
|---------------------------|---|----------------|-----------------|-------------------------------------|
| | Kend. ringan LV | Kend. Berat HV | Sepeda motor MC | |
| > 3 j | 60 | 4,5 | 35,5 | 0,01 |
| 1-3 j | 55,5 | 3,5 | 41 | 0,05 |
| 0,5-1 j | 40 | 3,0 | 57 | 0,14 |
| 0,1-0,5 j | 63 | 2,5 | 34,5 | 0,05 |
| <0,1 j | 63 | 2,5 | 34,5 | 0,05 |

Sumber : MKJI 1997

Tabel 2.4 Nilai Normal Lalu Lintas Umum

| Faktor | Normal |
|---------------------------------|--------|
| Rasio arus jalan minor P_{MI} | 0,25 |
| Rasio belok-kiri P_{LT} | 0,15 |
| Rasio belok-kanan P_{RT} | 0,15 |
| Faktor-smp, F_{smp} | 0,85 |

Sumber : MKJI 1997

2.2.6.1.3 Kondisi Lingkungan

Data lingkungan berikut diperlukan untuk perhitungan dan harus diisikan dalam kotak di bagian kanan atas Formulir USIG-II ANALISA.

1. Kelas ukuran kota

Masukkan perkiraan jumlah penduduk dari seluruh daerah perkotaan dalam juta.

Tabel 2.5 Kelas Ukuran Kota

| Ukuran kota | Jumlah penduduk (juta) |
|--------------|------------------------|
| Sangat kecil | <0,1 |
| Kecil | 0,1-0,5 |
| Sedang | 0,5-1,0 |
| Besar | 1,0-3,0 |
| Sangat besar | >3,0 |

Sumber : MKJI 1997

2. Tipe lingkungan jalan

Menurut tata guna tanah dan aksesibilitas tersebut dari aktivitas sekitarnya. Hal ini ditetapkan secara kualitatif dari pertimbangan teknik lalu-lintas.

Tabel 2.6 Tipe Lingkungan Jalan

| | |
|----------------|---|
| Komersial | Tata guna lahan komersial (misalnya pertokoan, rumah makan, perkantoran) dengan jalan masuk langsung bagi pejalan kaki dan kendaraan. |
| Permukiman | Tata guna lahan tempat tinggal dengan jalan masuk langsung bagi pejalan kaki dan kendaraan. |
| Akses terbatas | Tanpa jalan masuk atau jalan masuk langsung terbatas (misalnya karena adanya penghalang fisik, jalan samping dsb). |

Sumber : MKJI 1997

3. Kelas hambatan samping

Hambatan samping menunjukkan pengaruh aktivitas samping jalan di daerah simpang pada arus berangkat lalu-lintas, misalnya pejalan kaki berjalan atau menyeberang jalur, angkutan kota dan bis berhenti untuk menaikkan dan menurunkan penumpang, kendaraan masuk dan keluar halaman dan tempat parkir diluar jalur. Hambatan samping ditentukan secara kualitatif dengan

pertimbangan teknik lalu-lintas sebagai tinggi, sedang, atau rendah.

2.2.6.2 Kapasitas

Lebar Pendekat dan Tipe Simpang

1. Lebar rata-rata pendekat minor dan utama W_{AC} dan W_{BD} dan lebar rata-rata pendekat W_I .

- Lebar rata-rata pendekat, W_I

$$W_I = (a/2 + b + c/2 + d/2)/4 \dots\dots\dots (2.6)$$

(Pada lengan B ada median)

- Jika A hanya untuk keluar, maka $a=0$:

$$W_I = (b + c/2 + d/2)/3 \dots\dots\dots (2.7)$$

- Lebar rata-rata pendekat minor dan utama (lebar masuk)

$$W_{AC} = (a/2 + c/2)/2 \quad W_{BD} = (b + d/2)/2 \dots\dots (2.8)$$

Gambar 2.3 Contoh Lebar Rata-Rata Pendekat

Sumber : MKJI 1997

2. Jumlah lajur

Jumlah lajur yang digunakan untuk keperluan perhitungan ditentukan dari lebar rata-rata pendekat jalan minor dan jalan utama sebagai berikut. Tentukan jumlah lajur berdasarkan lebar rata-rata pendekat jalan minor dan jalan utama dari Gambar 2.3 di atas, dan masukkan hasilnya dalam Kolom 9 dan 10.

Tabel 2.7 Jumlah Lajur dan Lebar Rata-Rata Pendekat Minor dan Utama

| Lebar rata-rata pendekat minor dan utama W_{AC} , W_{BD} (m) | Jumlah lajur (total untuk kedua arah) |
|--|---------------------------------------|
| $W_{BD} = (b+d/2)/2 < 5,5$ | 2 |
| $\geq 5,5$ | 4 |
| $W_{AC} = (a+c/2)/2 < 5,5$ | 2 |
| $\geq 5,5$. | 4 |

Sumber : MKJI 1997

3. Tipe Simpang

Tipe simpang, menentukan jumlah lengan simpang dan jumlah lajur pada jalan utama dan jalan minor pada simpang tersebut dengan kode tiga angka, lihat Tabel 2.8. Jumlah lengan adalah jumlah lengan dengan lalu-lintas masuk atau keluar atau keduanya. Masukkan hasil kode tipe simpang (IT) ke dalam Kolom 1.1.

Tabel 2.8 Kode Tipe Simpang

| Kode IT | Jumlah lengan simpang | Jumlah lajur jalan minor | Jumlah lajur jalan utama |
|---------|-----------------------|--------------------------|--------------------------|
| 322 | 3 | 2 | 2 |
| 324 | 3 | 2 | 4 |
| 342 | 3 | 4 | 2 |
| 422 | 4 | 2 | 2 |
| 424 | 4 | 2 | 4 |

Sumber : MKJI 1997

Kapasitas Dasar (C_0)

Nilai kapasitas dasar diambil dari Tabel 2.9 dan dimasukkan dalam Kolom 20 pada Formulir USIG-II. Variabel masukkan adalah tipe simpang IT. Lihat juga catatan di atas tentang tipe simpang 344 dan 444.

Tabel 2.9 Kapasitas Dasar Menurut Tipe Simpang

| Tipe simpang IT | Kapasitas dasar (smp/jam) |
|-----------------|---------------------------|
| 322 | 2700 |
| 342 | 2900 |
| 324 atau 344 | 3200 |
| 422 | 2900 |
| 424 atau 444 | 3400 |

Sumber : MKJI 1997

Faktor Penyesuaian Lebar Pendekat (F_w)

Penyesuaian lebar pendekat, (F_w), diperoleh dari Gambar 2.4, dan dimasukkan pada Kolom 21. Variabel masukkan adalah lebar rata-rata semua pendekat W_1 dan tipe simpang IT. Batas nilai yang diberikan dalam gambar adalah rentang dasar empiris dari manual.

**Gambar 2.4** Faktor Penyesuaian Lebar Pendekat (F_w)

Sumber : MKJI 1997

Faktor Penyesuaian Median Jalan Utama

Pertimbangan teknik lalu-lintas diperlukan untuk menentukan faktor median. Median disebut lebar jika kendaraan ringan standar dapat berlindung pada daerah median tanpa mengganggu arus berangkat pada jalan utama. Hal ini mungkin terjadi jika lebar median 3m atau lebih. Pada beberapa keadaan, misalnya jika pendekat

jalan utama lebar, hal ini mungkin terjadi jika median lebih sempit. Klasifikasi median dimasukkan ke dalam Formulir USIG-I (di bawah sketsa geometrik).

Faktor penyesuaian median jalan utama diperoleh dengan menggunakan Tabel 2.10 dan hasilnya dimasukkan dalam Kolom 22. Penyesuaian hanya digunakan untuk jalan utama dengan 4 lajur. Variabel masukan adalah tipe median jalan utama.

Tabel 2.10 Faktor Penyesuaian Median Jalan Utama (F_M)

| Uraian | Tipe M | Faktor penyesuaian median, (F_M) |
|--|-----------|--------------------------------------|
| Tidak ada median jalan utama | Tidak ada | 1,00 |
| Ada median jalan utama, lebar <3m | Sempit | 1,05 |
| Ada median jalan utama, lebar ≥ 3 m | Lebar | 1,20 |

Sumber : MKJI 11997

Faktor Penyesuaian Ukuran Kota (F_{CS})

Faktor penyesuaian ukuran kota ditentukan dari Tabel 2.11 dan hasilnya dimasukkan dalam Kolom 23.

Tabel 2.11 Faktor Penyesuaian Ukuran Kota (F_{CS})

| Ukuran kota CS | Penduduk (juta) | Faktor penyesuaian ukuran kota (F_{CS}) |
|----------------|-----------------|---|
| Sangat kecil | <0,1 | 0,82 |
| Kecil | 0,1-0,5 | 0,88 |
| Sedang | 0,5-1,0 | 0,94 |
| Besar | 1,0-3,0 | 1,00 |
| Sangat besar | >3,0 | 1,05 |

Sumber : MKJI 1997

✚ Faktor Penyesuaian Tipe Lingkungan Jalan, Hambatan samping dan Kendaraan Tak Bermotor (F_{RSU})

Faktor penyesuaian tipe lingkungan jalan, hambatan samping dan kendaraan tak bermotor (F_{RSU}), dihitung dengan menggunakan Tabel 2.12 dibawah, dan hasilnya dicatat pada Kolom 24. Variabel masukan adalah tipe lingkungan jalan RE, kelas hambatan samping SF dan rasio kendaraan tak bermotor UM/MV (dari Formulir USIG-I, Baris 24, Kolom 12).

Tabel 2.12 Faktor Penyesuaian Tipe Lingkungan Jalan, Hambatan Samping, dan Kendaraan Tak Bermotor (F_{RSU})

| Kelas tipe lingkungan jalan | Kelas hambatan samping | Rasio kendaraan tak bermotor P_{UM} | | | | | |
|-----------------------------|--------------------------|---------------------------------------|------|------|------|------|-------------|
| | | 0,00 | 0,05 | 0,10 | 0,15 | 0,20 | $\geq 0,25$ |
| Komersial | Tinggi | 0,93 | 0,88 | 0,84 | 0,79 | 0,74 | 0,70 |
| | Sedang | 0,94 | 0,89 | 0,85 | 0,80 | 0,75 | 0,70 |
| | Rendah | 0,95 | 0,90 | 0,86 | 0,81 | 0,76 | 0,71 |
| Permukiman | Tinggi | 0,96 | 0,91 | 0,86 | 0,82 | 0,77 | 0,72 |
| | Sedang | 0,97 | 0,92 | 0,87 | 0,82 | 0,77 | 0,73 |
| | Rendah | 0,98 | 0,93 | 0,88 | 0,83 | 0,78 | 0,74 |
| Akses terbatas | Tinggi/sedang/ rendah | 1,00 | 0,95 | 0,90 | 0,85 | 0,80 | 0,75 |

Sumber : MKJI 1997

Tabel berdasarkan anggapan bahwa pengaruh kendaraan tak bermotor terhadap kapasitas adalah sama seperti kendaraan ringan, yaitu $emp_{UM} = 1,0$. Persamaan berikut dapat digunakan jika pemakai mempunyai bukti bahwa yang mungkin merupakan keadaan jika kendaraan tak bermotor tersebut terutama berupa sepeda.

$$F_{RSU} (P_{UM} \text{ sesungguhnya}) = F_{RSU} (P_{UM} = 0) \times (1 - P_{UM} \times emp_{UM}) \dots (2.9)$$

✚ Faktor Penyesuaian Belok Kiri (P_{LT})

Variabel masukan adalah belok kiri, P_{LT} dari Formulir USIG-I Baris 20, Kolom 11. Batas nilai yang diberikan untuk P_{LT} adalah rentang, empiris dari manual.

Gambar 2.5 Faktor Penyesuaian Belok Kiri (F_{LT})

Sumber : MKJI 1997

Faktor Penyesuaian Belok Kanan (F_{RT})

Faktor penyesuaian belok kanan ditentukan dari Gambar 2.6 di bawah untuk simpang 3 lengan.

Variabel masukan adalah belok kanan, P_{RT} dari Formulir USIG-I, Baris 22, Kolom 11.

Batas nilai yang diberikan untuk P_{RT} pada gambar adalah rentang dasar empiris dari manual. Untuk simpang 4-lengan $F_{RT} = 1,0$.

Gambar 2.6 Faktor Penyesuaian Belok Kanan (F_{RT})

Sumber : MKJI 1997

✚ Faktor Penyesuaian Rasio Arus Jalan Minor (F_{MI})

Faktor penyesuaian rasio arus jalan minor ditentukan dari Gambar 2.7 di bawah.

Variabel masukan adalah rasio arus jalan minor (P_{MI} , dari Formulir USIG-I Baris 24, Kolom 10) dan tipe simpang IT (USIG-II Kolom 11). Batas nilai yang diberikan untuk P_{MI} pada gambar adalah rentang, dasar empiris dari manual.

Faktor penyesuaian rasio arus jalan minor ditentukan dari **Gambar 2.7** di bawah.

Gambar 2.7 Faktor Penyesuaian Arus Jalan Minor (F_{MI})

Sumber : MKJI 1997

Tabel 2.13 Faktor Penyesuaian Arus Jalan Minor (F_{MI})

| IT | F_{MI} | P_{MI} |
|-----|---|----------|
| 422 | $1,19xp_{MI}^2 - 1,19xp_{MI} + 1,19$ | 0,1-0,9 |
| 424 | $16,6xp_{MI}^4 - 33,5xp_{MI}^3 + 25,3xp_{MI}^2 - 8,6xp_{MI} + 1,95$ | 0,1-0,3 |
| 444 | $1,11xp_{MI}^2 - 1,11xp_{MI} + 1,11$ | 0,3-0,9 |
| 322 | $1,19xp_{MI}^2 - 1,19xp_{MI} + 1,19$ | 0,1-0,5 |
| | $-0,595xp_{MI}^2 + 0,595xp_{MI}^3 + 0,74$ | 0,5-0,9 |
| 342 | $1,19xp_{MI}^2 - 1,19xp_{MI} + 1,19$ | 0,1-0,5 |
| | $2,38xp_{MI}^2 - 2,38xp_{MI} + 1,49$ | 0,5-0,9 |
| 324 | $16,6xp_{MI}^4 - 33,3xp_{MI}^3 + 25,3xp_{MI}^2 - 8,6xp_{MI} + 1,95$ | 0,1-0,3 |
| 344 | $1,11xp_{MI}^2 - 1,11xp_{MI} + 1,11$ | 0,3-0,5 |
| | $-0,555xp_{MI}^2 + 0,555xp_{MI} + 0,69$ | 0,5-0,9 |

Sumber : MKJI 1997

Kapasitas

Kapasitas, dihitung dengan menggunakan rumus berikut, dimana berbagai faktornya telah dihitung diatas :

$$C = C_0 \times F_W \times F_M \times F_{CS} \times F_{RSU} \times F_{LT} \times F_{RT} \times F_{MI} \text{ (smp/jam) } \dots\dots (2.10)$$

2.2.6.3 Perilaku Lalu Lintas

Derajat Kejenuhan

Derajat kejenuhan, dihitung dengan menggunakan rumus berikut. Hasilnya dicatat pada Kolom 31 Formulir USIG-II:

$$DS = Q_{TOT}/C \dots\dots\dots (2.11)$$

Dimana:

Q_{TOT} = Arus total (smp/jam) dari Formulir USIG-I,
Baris 23, Kolom 10

C = Kapasitas dari Formulir USIG-II Kolom 28

Tundaan

1. Tundaan Lalu Lintas Simpang (DT_i)

Tundaan lalu-lintas simpang adalah tundaan lalu-lintas, rata-rata untuk semua kendaraan bermotor

yang masuk simpang. DT_I ditentukan dari kurva empiris antara DT_I dan DS , lihat Gambar 2.8.

Gambar 2.8 Tundaan Lalu Lintas Simpang VS Derajat Kejenuhan

Sumber : MKJI 1997

Variabel masukan adalah derajat kejenuhan dari formulir USIG-II, Kolom 31. Masukkan hasilnya dalam formulir USIG-II Kolom 32.

2. Tundaan Lalu Lintas Jalan Utama (DT_{MA})

Tundaan lalu-lintas jalan utama adalah tundaan lalu-lintas rata-rata semua kendaraan bermotor yang masuk persimpangan dari jalan utama. DT_{MA} ditentukan dari kurva empiris antara DT_{MA} dan DS , lihat Gambar 2.9.

Gambar 2.9 Tundaan Lalu Lintas Jalan Utama VS Derajat Kejenuhan

Sumber : MKJI 1997

Variabel masukan adalah derajat kejenuhan dari formulir USIG-II, Kolom 31 Masukkan hasilnya dalam formulir USIG-II, Kolom 33.

3. Penentuan Tundaan Lalu Lintas Jalan Minor (DT_{MI})

Tundaan lalu-lintas jalan minor rata-rata, ditentukan berdasarkan tundaan simpang rata-rata dan tundaan jalan utama rata-rata.

$$DT_{MI} = (Q_{TOT} \times DT_i - Q_{MA} \times DT_{MA}) / Q_{MI} \dots\dots\dots (2.12)$$

Variabel masukan adalah arus total Q_{TOT} (smp/jam) dari formulir USIG-I Kolom 10 baris 23, tundaan lalu-lintas simpang DT_i , dari formulir USIG-II kolom 32, Arus jalan utama Q_{MA} dari formulir USIG-I kolom 10 baris 19, tundaan lalu-lintas jalan utama DT_{MA} dari formulir USIG-II

kolom 33, dan arus jalan minor Q_{MI} dari formulir USIG-I kolom 10 baris 10.

Masukkan hasilnya dalam formulir USIG-II kolom 34.

4. Tundaan Geometrik Simpang (DG)

Tundaan geometrik simpang adalah tundaan geometrik rata-rata seluruh kendaraan bermotor yang masuk simpang. DG dihitung dari rumus berikut:

Untuk $DS < 1,0$:

$$DG = (1-DS) \times (P_T \times 6 + (1-P_T) \times 3) + DS \times 4 \text{ (det/smp)} \dots\dots\dots (2.13)$$

Untuk $DS \geq 1,0$: $DG = 4$

Dimana:

DG = Tundaan geometrik simpang

DS = Derajat kejenuhan (Form USIG-II Kolom 31)

P_T = Rasio belok total (Form USIG-I Kolom 11, Baris 23)

Masukkan hasilnya dalam formulir USIG-II Kolom 35.

5. Tundaan Simpang (D)

Tundaan simpang dihitung sebagai berikut :

$$D = DG + DT_I \text{ (det/smp)} \dots\dots\dots (2.14)$$

Dimana:

DG = Tundaan geometrik simpang
(Form USIG-II, Kolom 35)

DT_I = Tundaan lalu-lintas simpang
(Form USIG-II, Kolom 32)

Masukkan hasilnya dalam Form USIG-II Kolom 36.

Peluang Antrian

Rentang nilai peluang antrian ditentukan dari hubungan empiris antara peluang antrian dan derajat kejenuhan, lihat Gambar 2.10.

Hasilnya dicatat pada Formulir USIG-II, Kolom 35.

Gambar 2.10 Rentang Peluang Antrian (QP%) Terhadap Derajat Kejenuhan (DS)

Sumber : MKJI 1997

Penilaian Perilaku Lalu Lintas

Manual ini terutama direncanakan untuk memperkirakan kapasitas dan perilaku lalu-lintas pada kondisi tertentu berkaitan dengan rencana geometrik jalan, lalu-lintas dan lingkungan. Karena hasilnya biasanya tidak dapat diperkirakan sebelumnya, mungkin diperlukan beberapa perbaikan dengan pengetahuan para ahli lalu-lintas, terutama kondisi geometrik, untuk memperoleh perilaku lalu-lintas yang diinginkan berkaitan dengan kapasitas dan tundaan dan sebagainya. Sasaran yang dipilih diisikan dalam Formulir USIG-II, Kolom 38.

Cara yang paling cepat untuk menilai hasil adalah dengan melihat derajat kejenuhan (DS) untuk kondisi yang diamati, dan membandingkannya dengan pertumbuhan lalu-lintas tahunan dan "umur" fungsional yang diinginkan dari

simpang tersebut. Jika nilai DS yang diperoleh terlalu tinggi ($>0,75$), pengguna manual mungkin ingin merubah anggapan yang berkaitan dengan lebar pendekat dan sebagainya, dan membuat perhitungan yang baru. Hal ini akan membutuhkan formulir yang baru dengan soal yang baru. Penilaian tentang perhitungan ini dimasukkan dalam Formulir USIG-II, Kolom 39.

2.3 Prosedur Perhitungan Simpang Bersinyal

2.3.1 Data Masukan

2.3.1.1 Kondisi Geometrik Pengaturan Lalu Lintas dan Kondisi Lingkungan

Perhitungan dikerjakan secara terpisah untuk setiap pendekat. Satu lengan simpang dapat terdiri lebih dari satu pendekat, yaitu dipisahkan menjadi dua atau lebih sub pendekat. Hal ini terjadi jika gerakan belok kanan dan/atau belok kiri mendapat sinyal hijau pada fase yang berlainan dengan lalu-lintas yang lurus, atau jika dipisahkan secara fisik dengan pulau-pulau lalu-lintas dalam pendekat.

Untuk masing-masing pendekat atau sub pendekat lebar efektif (W_e) ditetapkan dengan mempertimbangkan denah dari bagian masuk dan ke luar suatu simpang dan distribusi dari gerakan-gerakan membelok.

Data-data untuk mengisi formulir dalam perhitungan yang sesuai dengan perintah yang ada pada masing-masing kolom yang tersedia, yaitu :

- a. Umum
Mengisi tanggal, dikerjakan oleh, nama kota, nama simpang, nomor halaman, dan waktu pada judul formulir.
- b. Ukuran kota
Masukkan jumlah penduduk perkotaan.
- c. Fase dan waktu sinyal
Masukkan waktu hijau (g) dan waktu antar hijau (IG) yang ada pada setiap kotak, dan masukkan waktu siklus

dan waktu hilang total ($LTI = \Sigma IG$) untuk kasus yang ditinjau (jika ada).

d. Belok kiri langsung

Tunjukkan dalam diagram-diagram fase dalam pendekatan-pendekat mana gerakan belok kiri langsung diijinkan (gerakan membelok tersebut dapat dilakukan dalam semua fase tanpa memperhatikan sinyal).

e. Denah

- Denah dan posisi dari pendekatan-pendekat, pulau-pulau lalu lintas, garis henti, penyeberangan pejalan kaki, marka jalur dan marka panah arah.
- Lebar pendekatan (ketelitian sampai persepuluh meter terdekat) dari bagian pendekatan perkerasan persimpangan, tempat masuk (entry) dan keluar (exit). Informasi ini juga dimasukkan di bagian formulir.
- Panjang lajur dengan panjang terbatas.
- Gambar panah pada sketsa untuk menunjukkan arah.

f. Kode pendekatan

Menggunakan arah mata angin atau tanda lainnya yang jelas untuk menamakan pendekatan-pendekat tersebut dengan memperhatikan bahwa lengan simpang dapat dibagi oleh pulu lalu lintas dua pendekatan atau lebih.

g. Tipe Lingkungan Jalan

Memsukkan tipe lingkungan jalan :

- Komersial (COM)
Tata guna lahan komersial, contoh : restoran, kantor, dengan jalan masuk langsung bagi pejalan kaki dan kendaraan.
- Permukiman (RES)
Tata guna lahan tempat tinggal dengan jalan masuk langsung bagi pejalan kaki dan kendaraan.
- Akses Terbatas (RA)
Jalan masuk terbatas atau tidak ada sama sekali.

- h. Tingkat hambatan samping
 - Tinggi
Besarnya arus berangkat pada tempat masuk dan keluar berkurang oleh karena aktivitas di samping jalan pada pendekat seperti angkutan umum berhenti, pejalan kaki berjalan di samping jalan.
 - Rendah
Besarnya arus berangkat pada tempat masuk dan keluar tidak berkurang oleh hambatan samping dari jenis-jenis yang disebut di atas.
- i. Median
Memasukkan data pada bagian kanan dari garis henti dalam pendekat meskipun ada atau tidaknya median.
- j. Kelandaian
Memasukkan kelandaian dalam % (naik = +%, turun = - %).
- k. LTOR / Belok Kiri Langsung
Jika belok kiri langsung (LTOR) diijinkan (ya/tidak) pada pendekat tersebut maka masukkan data tersebut untuk menunjukkan hal ini dalam diagram fase.
- l. Jarak ke kendaraan parkir pertama
Memasukkan jarak normal antara garis henti dan kendaraan parkir pertama pada bagian hilir dari pendekat pada kondisi yang dipelajari.
- m. Lebar Pendekat
Memasukkan data dari sketsa, lebar bagian yang diperkeras dari masing-masing pendekat, belok kiri langsung, tempat masuk dan tempat keluar (bagian tersempit setelah melewati jalan melintang).

2.3.1.2 Kondisi Arus Lalu Lintas

Data arus lalu lintas dapat digunakan jika datannya rinci dengan distribusi jenis kendaraan untuk masing-masing gerakan belok yang tersedia. Serta masukkan data arus lalu lintas untuk

masing-masing jenis kendaraan bermotor dalam kend/jam. Dan arus kendaraan tak bermotor.

Beberapa kumpulan data arus lalu lintas mungkin diperlukan untuk menganalisa periode lainnya, seperti jam puncak pagi, jam puncak siang, jam puncak sore.

Semua gerakan dan lalu lintas termasuk belok kiri langsung (LTOR). Tetapi gerakan LTOR tidak dimasukkan kedalam perhitungan waktu sinyal.

Menghitung arus lalu lintas dalam smp/jam bagi masing-masing jenis kendaraan untuk kondisi terlindung dan/atau terlawan (yang sesuai tergantung pada fase sinyal dan gerakan belok kanan yang diijinkan) dengan menggunakan emp berikut :

Tabel 2.14 Kondisi Arus Lalu Lintas

| Tipe kendaraan | emp | |
|-----------------------|----------------------------|--------------------------|
| | Pendekat terlindung | Pendekat terlawan |
| LV | 1,0 | 1,0 |
| HV | 1,3 | 1,3 |
| MC | 0,2 | 0,4 |

Sumber : MKJI 997

Menghitung arus lalu-lintas total Q_{MV} dalam kend/jam dan smp/jam pada masing-masing pendekat untuk kondisi-kondisi arus berangkat terlindung dan/atau terlawan (yang sesuai tergantung pada fase sinyal dan gerakan belok kanan yang diijinkan).

Menghitung untuk masing-masing pendekat rasio kendaraan belok kiri P_{LT} dan rasio belok kanan P_{RT} .

$$P_{LT} = \frac{LT \text{ (smp/jam)}}{\text{Total (smp/jam)}} \dots\dots\dots (2.15)$$

$$P_{RT} = \frac{RT \text{ (smp/jam)}}{\text{Total (smp/jam)}} \dots\dots\dots (2.16)$$

(bernilai sama untuk pendekat terlawan dan terlindung)

Menghitung rasio kendaraan tak bermotor dengan membagi arus kendaraan tak bermotor Q_{UM} kend/jam dengan arus kendaraan bermotor Q_{MV} kend/jam.

$$P_{UM} = Q_{UM} / Q_{MV} \dots\dots\dots (2.17)$$

2.3.2 Penggunaan Sinyal

2.3.2.1 Penentuan Fase Sinyal

Perhitungan akan dikerjakan untuk rencana fase sinyal yang lain, maka rencana fase sinyal harus dipilih sebagai alternatif permulaan untuk keperluan evaluasi.

Pengaturan dua fase dicoba untuk kejadian dasar, karena menghasilkan kapasitas yang lebih besar dan tundaan rata-rata lebih rendah daripada tipe fase sinyal lain dengan pengaturan fase yang biasa dengan pengaturan fase konvensional.

2.3.2.2 Waktu Antar Hijau dan Waktu Hilang

Pada analisa operasional dan perencanaan yang dilakukan untuk keperluan perancangan waktu antar hijau berikut (kuning + merah semua) dapat dianggap sebagai nilai normal.

Tabel 2.15 Nilai Normal Waktu Antar Hijau

| Ukuran Simpang | Lebar jalan rata-rata | Nilai normal waktu antar hijau |
|----------------|-----------------------|--------------------------------|
| Kecil | 6 - 9 m | 4 detik/fase |
| Sedang | 10 - 14 m | 5 detik/fase |
| Besar | ≥ 15 m | ≥ 6 detik/fase |

Sumber : MKJI 1997

Prosedur untuk perhitungan rinci waktu merah semua yang dilakukan untuk pengosongan pada akhir setiap fase harus memberi kesempatan bagi kendaraan terakhir berangkat dari titik konflik sebelum kedatangan kendaraan yang datang pertama dari fase berikutnya pada titik yang sama.

Gambar 2.11 Titik Konflik dan Jarak Untuk Keberangkatan dan Kedatangan

Sumber : MKJI 1997

Titik konflik kritis pada masing-masing fase (i) adalah titik yang menghasilkan waktu merah semua terbesar.

$$\text{Merah Semua} = \left[\frac{(L_{EV} + I_{EV})}{V_{EV}} - \frac{L_{AV}}{V_{AV}} \right]_{\max} \dots\dots\dots (2.18)$$

Dimana

L_{EV}, L_{AV} = Jarak dari garis henti ke titik konflik masing-masing untuk kendaraan yang berangkat dan yang datang (m)

I_{EV} = Panjang kendaraan yang berangkat (m)

V_{EV}, V_{AV} = Kecepatan masing-masing untuk kendaraan yang berangkat dan yang datang (m/det).

Apabila periode merah semua untuk masing-masing akhir fase telah ditetapkan, waktu hilang (LTI) untuk simpang dapat dihitung sebagai jumlah dari waktu-waktu antar hijau :

$$LTI = \sum (MERAH\ SEMUA + KUNING)_i = \sum IG_i \dots\dots\dots (2.19)$$

Panjang waktu kuning pada sinyal lalu-lintas perkotaan di Indonesia biasanya adalah 3,0 detik.

2.3.2.3 Panjang Antrian

Menghitung jumlah antrian smp (NQ_1) yang tersisa dari fase hijau sebelumnya.

Untuk $DS > 0,5$:

$$NQ_1 = 0,25 \times C \times \left((DS - 1) + \sqrt{(DS - 1)^2 + \frac{8 \times (DS - 0,5)}{C}} \right) \dots\dots (2.20)$$

Untuk $DS \leq 0,5$: $NQ_1 = 0$

Dimana :

NQ_1 = Jumlah smp yang tersisa dari fase hijau sebelumnya

DS = Derajat kejenuhan

GR = Rasio hijau

C = Kapasitas ($S \times GR$)

Gambar 2.12 Jumlah Kendaraan Antri (smp) yang Tersisa dari Fase Hijau Sederana (NQ_1)

Sumber : MKJI 1997

Menghitung jumlah antrian smp yang datang selama fase merah (NQ_2).

$$NQ_2 = cx \frac{1 - GR}{1 - GR \times DS} \times \frac{Q}{3600} \dots\dots\dots (2.21)$$

Dimana :

NQ_2 = Jumlah smp yang datang selama fase merah

DS = Derajat kejenuhan

GR = Rasio hijau

c = Waktu siklus (det)

Q_{masuk} = Arus lalu-lintas pada tempat masuk di luar
LTOR (smp/jam)

Jumlah kendaraan antri dan masukan hasilnya :

$$NQ = NQ_1 + NQ_2 \dots\dots\dots (2.22)$$

2.3.2.4 Tundaan

Menghitung Tundaan lalu-lintas rata-rata setiap pendekat (DT) akibat pengaruh timbal balik dengan gerakan-gerakan lainnya pada simpang sebagai berikut :

$$DT = cxA + \frac{NQ_1 \times 3600}{C} \dots\dots\dots (2.23)$$

Dimana :

DT = Tundaan lalu-lintas rata-rata (det/smp)

c = Waktu siklus yang disesuaikan (det)

$$A = \frac{0,5 \times (1 - GR)^2}{(1 - GR \times DS)}$$

GR = Rasio hijau (g/c)

DS = Derajat kejenuhan

NQ_1 = Jumlah smp yang tersisa dari fase hijau
sebelumnya

C = Kapasitas (smp/jam)

Gambar 2.13 Penentuan Tundaan Lalu Lintas Rata-Rata (DT)

Sumber : MKJI 1997

2.3.3 Penentuan Waktu Sinyal

2.3.3.1 Tipe Pendekat

Memasukkan Identifikasi dari setiap pendekat. Jika gerakan lalu-lintas pada suatu pendekat diberangkatkan pada fase yang berbeda, harus dicatat pada baris terpisah dan diperlakukan sebagai pendekat-pendekat terpisah dalam perhitungan selanjutnya. Apabila suatu pendekat mempunyai nyala hijau pada dua fase, di mana pada keadaan tersebut, tipe lajur dapat berbeda untuk masing-masing fase, satu baris sebaiknya digunakan untuk mencatat data masing-masing fase, dan satu baris tambahan untuk memasukkan hasil gabungan untuk pendekat tersebut.

Masukkan nomor dari fase yang masing-masing pendekat atau gerakannya mempunyai nyala hijau.

Menentukan tipe dari setiap pendekat terlindung (P) atau terlawan (O).

2.3.3.2 Lebar Pendekat Efektif

Menentukan lebar efektif (W_e) dari setiap pendekat berdasarkan informasi tentang lebar pendekat (W_A) lebar masuk (W_{MASUK}) dan lebar keluar (W_{KELUAR}).

- Prosedur untuk pendekat tanpa belok kiri langsung (LTOR)
Hanya untuk pendekat tipe P, jika $W_{KELUAR} < W_e \times (1 - P_{RT} - P_{LTOR})$, sebaiknya diberi nilai baru yang sama dengan W_{KELUAR} dan analisa penentuan waktu sinyal untuk pendekat ini dilakukan hanya untuk bagian lalu-lintas lurus saja.
- Prosedur untuk Pendekat dengan Belok Kiri Langsung (LTOR)

Lebar efektif (W_E) dapat dihitung untuk pendekat dengan pulau lalu-lintas, penentuan lebar masuk (W_{MASUK}) sebagaimana ditunjukkan pada Gambar 2.14 atau untuk pendekat tanpa pulau lalu-lintas yang ditunjukkan pada bagian kanan dari gambar. Pada keadaan terakhir $W_{MASUK} = W_A - W_{LTOR}$.

Gambar 2.14 Pendekat dengan dan Tanpa Pulau Lalu Lintas
Sumber : MKJI 1997

- a. Jika $W_{L\text{TOR}} \geq 2\text{m}$

Langkah A.1

$$W_e = \text{Min} \begin{cases} W_A - W_{L\text{TOR}} \\ W_{\text{MASUK}} \end{cases}$$

Langkah A.2

$$W_{\text{KELUAR}} < W_e \times (1 - P_{\text{RT}})$$

- b. Jika $W_{L\text{TOR}} < 2\text{m}$

Langkah B.1

$$W_e = \text{Min} \begin{cases} W_A \\ W_{\text{MASUK}} + W_{L\text{TOR}} \\ W_A (1 + P_{L\text{TOR}}) - W_{L\text{TOR}} \end{cases}$$

Langkah B.2

$$W_{\text{KELUAR}} < W_e \times (1 - P_{\text{RT}} - P_{L\text{TOR}}).$$

2.3.3.3 Arus Jenuh Dasar

Menentukan Arus jenuh dasar (S_0) untuk setiap pendekat seperti diuraian dibawah :

Untuk pendekat tipe P (arus terlindung)

$$S_0 = 600 \times W_e \text{ smp/jam hijau} \dots\dots\dots (2.24)$$

Gambar 2.15 Arus Jenuh Dasar Untuk Pendekat Tipe P

Sumber : MKJI 1997

2.3.3.4 Faktor Penyesuaian

Faktor penyesuaian ukuran kota ditentukan dari Tabel 2.16 sebagai fungsi dari ukuran kota yang tercatat.

Tabel 2.16 Faktor Penyesuaian Ukuran (Fcs)

| Penduduk kota (juta jiwa) | Faktor penyesuaian ukuran kota (FCS) |
|------------------------------|---|
| >3,0 | 1,05 |
| 1,0-3,0 | 1,00 |
| 0,5-1,0 | 0,94 |
| 0,1-,05 | 0,83 |
| <0,1 | 0,82 |

Sumber : MKJI 1997

- Faktor Penyesuaian Hambatan Samping

Ditentukan dari tabel 2.17 sebagai fungsi dari jenis lingkungan jalan, tingkat hambatan samping, dan rasio kendaraan tak bermotor.

Jika hambatan samping tidak diketahui, dapat dianggap sebagai tinggi agar tidak menilai kapasitas terlalu besar.

Tabel 2.17 Faktor Penyesuaian Untuk Tipe Lingkungan Jalan, Hambatan Samping dan Kendaraan Tak Bermotor (F_{SF})

| Lingkungan Jalan | Hambatan Samping | Tipe fase | Rasio kendaraan tak bermotor | | | | | |
|------------------|------------------|-----------|------------------------------|------|------|------|------|------|
| | | | 0 | 0.05 | 0.1 | 0.15 | 0.2 | 0.25 |
| COM | Tinggi | O | 0.93 | 0.88 | 0.84 | 0.79 | 0.74 | 0.7 |
| | | P | 0.93 | 0.91 | 0.88 | 0.87 | 0.85 | 0.81 |
| | Sedang | O | 0.94 | 0.89 | 0.85 | 0.8 | 0.75 | 0.71 |
| | | P | 0.94 | 0.92 | 0.89 | 0.88 | 0.86 | 0.82 |
| | Rendah | O | 0.95 | 0.9 | 0.86 | 0.81 | 0.76 | 0.72 |
| | | P | 0.95 | 0.93 | 0.9 | 0.89 | 0.87 | 0.83 |
| RES | Tinggi | O | 0.96 | 0.91 | 0.86 | 0.81 | 0.78 | 0.72 |
| | | P | 0.96 | 0.94 | 0.92 | 0.89 | 0.86 | 0.84 |
| | Sedang | O | 0.97 | 0.92 | 0.87 | 0.82 | 0.79 | 0.73 |
| | | P | 0.97 | 0.95 | 0.93 | 0.9 | 0.87 | 0.85 |
| | Rendah | O | 0.98 | 0.93 | 0.88 | 0.83 | 0.8 | 0.74 |
| | | P | 0.98 | 0.96 | 0.94 | 0.91 | 0.88 | 0.86 |
| RA | | O | 1 | 0.95 | 0.9 | 0.85 | 0.8 | 0.75 |
| | | P | 1 | 0.98 | 0.95 | 0.93 | 0.9 | 0.88 |

Sumber : MKJI 1997

- Faktor penyesuaian kelandaian ditentukan dari Gambar 2.16 sebagai fungsi dari kelandaian (GRAD).

Gambar 2.16 Faktor Penyesuaian Untuk Kelandaian (FG)

Sumber : MKJI 1997

- Faktor penyesuaian parkir

Ditentukan dari Gambar 2.17 Faktor Penyesuaian untuk pengaruh parkir dari lajur yang pendek (F_p) sebagai fungsi jarak dari garis henti sampai kendaraan yang diparkir pertama dan lebar pendekat (W_A). Kemudian masukkan hasilnya. Faktor ini dapat juga diterapkan untuk kasus-kasus dengan panjang lajur belok kiri terbatas.

F_p dapat juga dihitung dari rumus berikut, yang mencakup pengaruh panjang waktu hijau:

$$F_p = (L_p / 3 - (W_A - 2) \times (L_p / 3 - g) / W_A) / g \dots\dots\dots (2.25)$$

Dimana:

L_p = Jarak antara garis henti dan kendaraan yang diparkir pertama (m) (atau panjang dari lajur pendek).

W_A = Lebar pendekat (m)

g = Waktu hijau pada pendekat
(nilai normal 26 det)

Gambar 2.17 Faktor Penyesuaian Untuk Pengaruh Parkir dan Lajur Belok Kiri yang Pendek

Sumber : MKJI 1997

- Menghitung faktor penyesuaian berikut untuk nilai arus jenuh dasar hanya untuk pendekatan tipe P sebagai berikut:

1. Faktor penyesuaian belok kanan (F_{RT})

Ditetapkan sebagai fungsi dari rasio kendaraan belok kanan F_{RT} serta fungsi tersebut hanya digunakan untuk pendekatan tipe P, tanpa median, jalan dua arah, lebr efektif ditentukan oleh lebar masuk.

$$F_{RT} = 1,0 + P_{RT} \times 0,26 \quad \dots\dots\dots (2.26)$$

Atau didapatkan nilainya dari Gambar 2.18

Gambar 2.18 Faktor Penyesuaian Untuk Belok Kanan (F_{RT})

Sumber : MKJI 1997

2. Faktor penyesuaian belok kiri (F_{LT})

Ditentukan sebagai fungsi dari rasio belok kiri P_{LT} . Dan fungsi tersebut hanya digunakan untuk pendekatan tipe P tanpa LTOR, lebar efektif ditentukan oleh lebar masuk.

$$F_{LT} = 1,0 - P_{LT} \times 0,16 \quad \text{..... (2.27)}$$

Atau didapatkan nilainya dari Gambar 2.19

Gambar 2.19 Faktor Penyesuaian Untuk Pengaruh Belok Kiri (F_{LT})

Sumber : MKJI 1997

Menghitung nilai arus jenuh yang disesuaikan yaitu :

$$S = S_O \times F_{CS} \times F_{SF} \times F_G \times F_P \times F_{RT} \times F_{LT} \text{ smp/jam hijau (2.28)}$$

2.3.3.5 Rasio Arus atau Rasio Arus Jenuh

Masukkan arus lalu-lintas masing-masing pendekat (Q) dengan memperhatikan :

Apabila LTOR harus dikeluarkan dari analisa hanya gerakan-gerakan lurus dan belok kanan saja yang dimasukkan dalam nilai Q.

Apabila $W_e = W_{\text{KELUAR}}$ hanya gerakan lurus saja yang dimasukkan dalam nilai Q.

Apabila suatu pendekat mempunyai sinyal hijau dalam dua fase, yang satu untuk arus terlawan (O) dan yang lainnya arus terlindung (P), gabungan arus lalu-lintas sebaiknya dihitung sebagai smp rata-rata berbobot untuk kondisi terlawan dan terlindung dengan cara yang sama seperti pada perhitungan arus jenuh.

Menghitung Rasio Arus (FR) masing-masing pendekat :

$$FR = Q / S \quad \dots\dots\dots (2.29)$$

Memberi tanda rasio arus kritis (FR_{CRIT}) (=tertinggi) pada masing-masing fase.

Menghitung rasio arus simpang (IFR) sebagai jumlah dari nilai-nilai FR yang dilingkari (=kritis).

$$FR = \Sigma (FR_{\text{crit}}) \quad \dots\dots\dots (2.30)$$

Menghitung Rasio Fase (IFR) masing-masing fase sebagai rasio antara FR_{CRIT} dan IFR.

$$PR = FR_{\text{Crit}} / IFR \quad \dots\dots\dots (2.31)$$

2.3.3.6 Waktu Siklus dan Waktu Hijau

1. Waktu siklus sebelum penyesuaian

Menghitung waktu siklus sebelum penyesuaian (C_{ua}) untuk pengendalian waktu tetap

$$C_{ua} = (1,5 \times LTI + 5) / (1 - IFR) \dots\dots\dots (2.32)$$

Dimana:

C_{ua} = Waktu siklus sebelum penyesuaian sinyal (det)

LTI = Waktu hilang total per siklus (det)

IFR = Rasio arus simpang (FR_{CRIT})

2. Waktu Hijau

Menghitung waktu hijau (g) untuk masing-masing fase:

$$g_i = (C_{ua} - LTI) \times PR_i \dots\dots\dots (2.33)$$

Dimana:

g_i = Tampilan waktu hijau pada fase i (det)

C_{ua} = Waktu siklus sebelum penyesuaian (det)

LTI = Waktu hilang total per siklus
(bagian terbawah kolom 4)

PR_i = Rasio fase $FR_{CRIT} / \Sigma (FR_{CRIT})$ (dari Kolom 20).

3. Waktu Siklus yang Disesuaikan

Menghitung waktu siklus yang di sesuaikan (c) berdasar pada waktu hijau yang diperoleh dan telah dibulatkan dan waktu hilang (LTI).

$$c = \Sigma g + LTI \dots\dots\dots (2.34)$$

2.3.4 Kapasitas

2.3.4.1 Kapasitas

Menghitung kapasitas masing-masing pendekat :

$$C = S \times g/c \dots\dots\dots (2.35)$$

Menghitung derajat kejenuhan masing-masing pendekat.

$$DS = Q / C \dots\dots\dots (2.36)$$

2.3.4.2 Keperluan Untuk Perubahan

- **Penambahan lebar pendekat**

Jika mungkin untuk menambah lebar pendekat, pengaruh terbaik dari tindakan seperti ini akan diperoleh jika pelebaran dilakukan pada pendekat-pendekat dengan nilai FR kritis tertinggi.

- **Perubahan Fase Sinyal**

Jika pendekat dengan arus berangkat terlawan (tipe O) dan rasio belok kanan (P_{RT}) tinggi menunjukkan nilai FR kritis yang tinggi ($FR > 0,8$), suatu rencana fase alternatif dengan fase terpisah untuk lalu-lintas belok kanan mungkin akan sesuai. Menerapkan fase terpisah untuk lalu lintas belok kanan mungkin harus disertai dengan tindakan pelebaran.

Simpang dapat beroperasi dalam 4 fase, asalkan gerakan-gerakan belok kanan tidak terlalu tinggi (< 200 smp/jam).

- **Pelarangan gerakan belok-kanan**

Pelanggaran bagi satu atau lebih gerakan belok kanan biasanya menaikkan kapasitas. Meskipun sering terjadi, perancangan manajemen lalu-lintas yang tepat, perlu untuk memastikan agar perjalanan oleh gerakan belok kanan yang akan dilarang tersebut dapat diselesaikan tanpa jalan pengalih yang terlalu panjang dan mengganggu simpang yang berdekatan.

2.3.5 Perilaku Lalu Lintas

2.3.5.1 Persiapan

- Mengisi informasi-informasi yang diperlukan ke judul.
- Memasukkan kode pendekat. Untuk pendekat dengan keberangkatan lebih dari satu fase hanya satu baris untuk gabungan fase yang dimasukkan.
- Memasukkan arus lalu-lintas (Q , smp/jam) pendekat.
- Memasukkan kapasitas (C , smp/jam) masing-masing pendekat.

- Memasukkan derajat kejenuhan (DS) masing-masing pendekat.
- Menghitung rasio hijau (GR = g/c) masing-masing pendekat dari hasil penyesuaian.
- Memasukkan arus total dari seluruh gerakan LTOR dalam smp/jam yang diperoleh sebagai jumlah dari seluruh gerakan LTOR.
- Masukkan dalam kotak di bawah kolom 2, perbedaan antara arus masuk dan keluar pendekat yang lebar keluarnya telah menentukan lebar efektif pendekat.

2.3.5.2 Panjang antrian

Menghitung jumlah antrian smp yang tersisa dari fase hijau sebelumnya.

Untuk $DS > 0,5$:

$$NQ_1 = 0,25 \times Cx \left((DS - 1) + \sqrt{(DS - 1)^2 + \frac{8x(DS - 0,5)}{C}} \right) \dots\dots\dots (2.37)$$

Untuk $DS \leq 0,5$: $NQ_1 = 0$

Dimana :

NQ_1 = Jumlah smp yang tersisa dari fase hijau sebelumnya

DS = Derajat kejenuhan

GR = Rasio hijau

C = Kapasitas ($S \times GR$)

Gambar 2.20 Jumlah Kendaraan Antri (smp) yang Tersisa dari Fase Hijau Sebelumnya
Sumber : MKJI 1997

Menghitung jumlah antrian smp yang datang selama fase merah (NQ_2).

$$NQ_2 = c \times \frac{1 - GR}{1 - GR \times DS} \times \frac{Q}{3600} \dots\dots\dots (2.38)$$

Dimana:

NQ_2 = Jumlah smp yang datang selama fase merah

DS = Derajat kejenuhan

GR = Rasio hijau

C = Waktu siklus (det)

Q_{masuk} = Arus lalu-lintas pada tempat masuk di luar LTOR (smp/jam)

Jumlah kendaraan antri dan masukkan hasilnya :

$$NQ = NQ_1 + NQ_2 \dots\dots\dots (2.39)$$

Menggunakan Gambar 2.21 untuk menyesuaikan NQ dalam hal peluang yang diinginkan untuk terjadinya pembebanan lebih (P_{OL}). Untuk perancangan dan perencanaan disarankan $P_{OL} \leq 5\%$, untuk operasi suatu nilai $P_{OL} = 5-10\%$ mungkin bisa diterima.

Hitung panjang antrian (QL) :

$$QL = \frac{NQ_{MAX} \times 20}{W_{MASUK}} \dots\dots\dots (2.40)$$

PELUANG UNTUK PEMBEBANAN LEBIH P_{OL}

Gambar 2.21 Perhitungan Jumlah Antrian (NQ_{MAX}) Dalam smp
Sumber : MKJI 1997

2.3.5.3 Kendaraan Terhenti

1. Menghitung angka henti (NS) masing-masing pendekat yang didefinisikan sebagai jumlah rata-rata berhenti per smp, dengan rumus :

$$NS = 0,9 \frac{NQ}{Q_{xc}} \times 3600 \dots\dots\dots (2.41)$$

Dimana:

c = Waktu siklus (det)

Q = Arus lalu-lintas (smp/jam)

2. Menghitung jumlah kendaraan terhenti (N_{SV}) masing-masing pendekat.

$$N_{SV} = Q \times NS \text{ (smp/jam)} \dots\dots\dots (2.42)$$

3. Menghitung angka henti seluruh simpang dengan cara membagi jumlah kendaraan terhenti pada seluruh pendekat dengan arus simpang total Q dalam kend/jam.

$$NS_{TOT} = \frac{\sum N_{SV}}{Q_{TOT}} \dots\dots\dots (2.43)$$

2.3.5.4 Tundaan

1. Hitung Tundaan lalu-lintas rata-rata setiap pendekat (DT) akibat pengaruh timbal balik dengan gerakan-gerakan lainnya pada simpang sebagai berikut :

$$DT = cxA + \frac{NQ_1 \times 3600}{C} \dots\dots\dots (2.44)$$

Dimana :

DT = Tundaan lalu-lintas rata-rata (det/smp)

c = Waktu siklus yang disesuaikan (det)

A = $\frac{0,5 \times (1 - GR)^2}{(1 - GR \times DS)}$

GR = Rasio hijau (g/c)

DS = Derajat kejenuhan
 NQ₁ = Jumlah smp yang tersisa dari fase hijau sebelumnya
 C = Kapasitas (smp/jam)

Gambar 2.22 Penetapan Tundaan Lalu Lintas Rata-Rata (DT)

Sumber : MKJI 1997

- Menentukan tundaan geometri rata-rata masing-masing pendekat (DG) akibat perlambatan dan percepatan ketika menunggu giliran pada suatu simpang dan/atau ketika dihentikan oleh lampu merah:

$$DG_j = (1 - P_{SV}) \times P_T \times 6 + (P_{SV} \times 4) \dots\dots\dots (2.45)$$

Dimana:

DG_j = Tundaan geometri rata-rata untuk pendekat j
(det/smp)

P_{SV} = Rasio kendaraan terhenti pada pendekat = Min
(NS,1)

P_T = Rasio Kendaraan berbelok pada pendekat dari
Formulir SIG-IV

3. Menghitung tundaan geometrik gerakan lalu-lintas dengan belok kiri langsung (LTOR).
4. Menghitung tundaan rata-rata (det/smp).
5. Menghitung tundaan total dalam detik dengan mengalikan tundaan rata-rata dengan arus lalu lintas.
6. Menghitung tundaan rata-rata untuk seluruh simpang (D_1).

$$DI = \frac{\Sigma(Q - Dj)}{Q_{TOT}} \dots\dots\dots (2.46)$$

7. Tundaan rata-rata dapat digunakan sebagai indikator tingkat pelayanan dari masing-masing pendekat demikian juga dari suatu simpang secara keseluruhan.

2.4 LEVEL OF SERVICE (LOS)

Pada umumnya tujuan dari adanya tingkat pelayanan adalah untuk melayani seluruh kebutuhan lalu lintas (*demand*) dengan sebaik mungkin. Baiknya pelayanan dapat dinyatakan dalam tingkat pelayanan (*Level Of Service*).

Level Of Service (LOS) merupakan ukuran kualitas sebagai rangkaian dari beberapa faktor yang mencakup kecepatan kendaraan dan waktu perjalanan, interupsi lalu lintas, kebebasan untuk manuver, keamanan, kenyamanan mengemudi, dan ongkos operasi (operation cost), sehingga LOS sebagai tolak ukur kualitas suatu kondisi lain lintas, maka volume pelayanan harus kurang dari kapasitas jalan itu sendiri. LOS yang tinggi didapatkan apabila *cycle time*-nya pendek, sebab *cycle time* yang

pendek akan menghasilkan delay yang kecil. Dalam klasifikasi pelayanannya LOS dibagi menjadi 6 tingkatan yaitu :

1. Tingkat Pelayanan A.

- a. Arus lalu lintas bebas tanpa hambatan
- b. Volume kepadatan lalu lintas rendah.
- c. Kecepatan kendaraan ditentukan oleh pengemudi

2. Tingkat Pelayanan B.

- a. Arus lalu lintas stabil.
- b. Kecepatan mulai dipengaruhi oleh keadaan lalu lintas, tetapi tetap dapat dipilih sesuai kehendak pengemudi

3. Tingkat Pelayanan C.

- a. Arus lalu lintas stabil
- b. Kecepatan perjalanan dan kebebasan bergerak sudah dipengaruhi oleh besarnya volume lalu lintas sehingga pengemudi tidak dapat lagi memilih kecepatan yang diinginkan

4. Tingkat Pelayanan D.

- a. Arus lalu lintas mulai memasuki arus tidak stabil
- b. Perubahan volume lalu lintas sangat mempengaruhi besarnya kecepatan perjalanan

5. Tingkat Pelayanan E.

- a. Arus lalu lintas sudah tidak stabil
- b. Volume kira-kira sama dengan kapasitas
- c. Sering terjadi kemacetan

6. Tingkat Pelayanan F.

- a. Arus lalu lintas tertahan pada kecepatan rendah
- b. Sering terjadi kemacetan total. .
- c. Arus lalu lintas rendah

Tingkat tundaan dapat digunakan sebagai indikator tingkat pelayanan, baik untuk setiap pendekat maupun seluruh persimpangan. Kaitan antara tingkat pelayanan dan lamanya tundaan adalah sebagai berikut :

Tabel 2.18 Tundaan Berhenti Pada Berbagai Tingkat Pelayanan (LOS)

| Tingkat Pelayanan | Tundaan (det/smp) | Keterangan |
|--------------------------|--------------------------|-------------------|
| A | <5 | Baik Sekali |
| B | 5,1 - 15 | Baik |
| C | 15,1 - 25 | Sedang |
| D | 25,1 - 40 | Kurang |
| E | 40,1 - 60 | Buruk |
| F | > 60 | Buruk Sekali |

Sumber : US-HCM,1994

2.5 Analisa Regresi

Analisa regresi ini dilakukan untuk memprediksikan jumlah kendaraan di tahun yang akan datang karena diperkirakan kendaraan setiap tahun kan bertambah. Dalam menentukan pertumbuhan kendaraan di ruas jalan jika menggunakan regresi minimal data volume yang harus didapatkan dalam minimal 3 tahun terakhir.

2.5.1 Model Analisa Regresi Linier Sederhana

Analisa regresi linier adalah metode statistic yang dapat digunakan untuk mempelajari hubungan antar sifat permasalahan yang sedang diselidiki. Analisa linier dapat memodelkan hubungan antara 2 perubahan atau lebih. Pada model ini terdapat peubah tidak bebas (y) yang mempunyai hubungan fungsional dengan 1 atau lebih peubah bebas (Xi). Dalam kasus yang paling sederhana, hubungan secara umum dapat dinyatakan dalam persamaan sebagai berikut :

$$Y' = a + Bx \dots\dots\dots (2.47)$$

Dimana :

- Y' = Persamaan yang dihasilkan (nilai yang diprediksikan)
 x = Tahun yang dicari
 a = Konstanta (nilai Y' apabila x = 0)
 B = Koefisien regresi (nilai peningkatan jika bernilai positif ataupun penurunan jika bernilai negative).

Parameter a dan b dapat diperkirakan dengan menggunakan metode kuadrat terkecil yang meminimumkan total kudratis residual antara hasil model dengan hasil pengamatan. Nilai parameter a dan b bisa didapatkan dari persamaan sebagai berikut :

$$b = \frac{n * \sum xy - (\sum x) - (\sum y)}{n * \sum x^2 - (\sum x^2)} \dots\dots\dots (2.48)$$

$$r = \frac{n * \sum xy - (\sum x * \sum y)}{\sqrt{((n * \sum x^2) - (\sum x^2)) * (n * \sum y^2 - (\sum y^2))}} \dots\dots\dots (2.49)$$

$$a = \frac{(\sum y) (\sum x^2) - (\sum x) (\sum xy)}{n * \sum x^2 - (\sum x^2)} \dots\dots\dots (2.50)$$

Dimana :

- a, b = Koefisien regresi
 n = Jumlah data pengamatan
 x = Variabel bebas
 y = Variabel tak bebas

Nilai r yang didapatkan nantinya antara -1 hingga 1, apabila didapat nilai r = 1 atau

r = -1 maka hubungan antara x dan y sangat kuat, atau dapat menggunakan persamaan yang ada diatas. Dan apabila harga r = 0 maka persamaan tersebut tidak layak.

Multiple R (R majemuk) merupakan suatu ukuran yang mengatur tentang tingkat (keeratan) hubungan linier antara variable terikat dengan seluruh variable bebas secara bersamaan. Pada kasus dua variable (satu variable dan satu variable bebas), besaran r (bias dituliskan dengan huruf kecil untuk dua variable) dapat bernilai positif maupun negative (antara -1 s/d 1), dan untuk lebih dari dua variable besaran r yang lebih besar (+ atau -) menunjukkan hubungan yang kuat.

R square (R^2) sering disebut juga dengan koefisien determinasi, yang merupakan pengukuran kebaikan yang sesuai dengan persamaan regresi, dimana memberikn proporsi atau prosentase variasi total dalam variable terikat.

Variable bebas. Nilai R^2 terletak antara 0 – 1, dan kecocokan modelnya dikatakan lebih baik apabila R^2 semakin mendekati 1. (Uraian lebih lanjut dapat dilihat pada pembahasan dibawah).

Untuk melihat seberapa kuat hubungan antara kedua variable dan untuk melihat besar variable (Y) yang dipengaruhi oleh variable (X) dapat dilihat pada Tabel 2.19 berikut :

Tabel 2.19 Interpolasi Nilai R

| R | Interprestasi |
|-------------|----------------------|
| 0 | Tidak Berkorelasi |
| 0.01 – 0.20 | Sangat Rendah |
| 0.21 – 0.40 | Rendah |
| 0.41 – 0.60 | Agak Rendah |
| 0.61 – 0.80 | Cukup |
| 0.81 – 0.99 | Tinggi |
| 1 | Sangat Tinggi |

Sumber : Hartono, M. Pd Statistic untuk Penelitian

2.5.2 Faktor Pertumbuhan

Dengan mengetahui besarnya factor pertumbuhan kendaraan yang mencerminkan kondisi lalu lintas pada tahun rencana dapat dihitung sehingga desain yang direncanakan dapat diketahui apakah masih memungkinkan menampung volume kendaraan yang semakin bertambah tiap tahun.

Bentuk umum dari persamaan perhitungan factor pertumbuhan lalu lintas dapat dituliskan sebagai berikut :

$$i = (y_2 - y_1)/y_1 \times 100\% \dots\dots\dots (2.50)$$

Dimana :

- i = Kenaikan kendaraan dalam 1 tahun
- y₁ = Jumlah kendaraan/tahun pertama
- y₂ = Jumlah kendaraan/tahun kedua

BAB III METODOLOGI

3.1 Tujuan Metodologi

Tujuan dari metodologi adalah untuk mempermudah pelaksanaan dalam mengerjakan Tugas Akhir Terapan, guna memperoleh pemecahan masalah sesuai dengan maksud dan tujuan yang telah ditetapkan melalui prosedur kerja yang sistematis, teratur, tertib. Sehingga dapat dipertanggungjawabkan secara ilmiah.

3.2 Metodologi yang Digunakan

Metodologi yang digunakan untuk penyusunan Tugas Akhir Terapan ini meliputi :

1. Persiapan administrasi

Pekerjaan administrasi meliputi :

- a. Mengurus surat-surat perijinan yang diperlukan misal : surat pengantar dari Kaprodi Diploma III Teknik Sipil ITS untuk pengambilan data di lapangan ataupun kantor.
- b. Mencari informasi sekaligus meminta data-data kepada instansi yang terkait, antara lain: Dinas Perhubungan Kota Surabaya dan Kantor Badan Pusat Statistik Kota Surabaya.
- c. Mencari, mengumpulkan, dan mempelajari segala bentuk kegiatan yang dapat mendukung dalam penyusunan Tugas Akhir Terapan.

2. Pengumpulan data

Pengumpulan data ini diperoleh dari survey langsung di lapangan dan dari instansi terkait. Data-data yang dimaksudkan adalah data primer dan data sekunder.

1. Data Primer

- a. Data geometrik lalu lintas
Data geometrik diperoleh dari pengukuran lapangan yang meliputi data lebar pendekat dan data bahu jalan.

b. Data arus lalu lintas

Data arus lalu lintas adalah data arus kendaraan tiap-tiap pendekat yang dibagi dalam 3 arus, yaitu:

- Arus kendaraan lurus (ST)
- Arus kendaraan belok kanan (RT), dan
- Arus kendaraan belok kiri mengikuti traffic light (LT) atau belok kiri langsung (LTOR)

Masing-masing pendekat terdapat beberapa jenis kendaraan yang disurvei, yaitu:

- Sepeda motor (MC)
- Kendaraan ringan (LV)
- Kendaraan berat (HV)
- Kendaraan tak bermotor (UM)

➤ Metode Survey

Adapun metode survey yang akan dilakukan adalah sebagai berikut :

1. Survey dilakukan selama 3 periode jam puncak selama 2 hari (*weekday* dan *weekend*). Setelah melakukan survey pendahuluan, didapatkan pelaksanaan survey volume lalu lintas untuk hari kerja yaitu hari Selasa, 17 Januari 2017, sedangkan untuk hari libur yaitu hari Sabtu, 21 Januari 2017.
2. Survey volume lalu lintas dilakukan selama 3 periode jam puncak. Untuk puncak pagi adalah jam 06.00 s/d 09.00, puncak siang adalah jam 11.00 s/d 14.00, puncak sore adalah jam 16.00 s/d 19.00.
3. Jumlah Surveyor untuk setiap *U-Turn* yaitu 2 orang. *U-Turn* yang ditinjau antara lain *U-Turn* Jl. Rungkut Tengah dan *U-Turn* Jl. Rungkut Industri Kidul. Terdapat 2 pergerakan untuk survey *traffic counting U-Turn*, jadi surveyor yang dibutuhkan sebanyak 4 orang.
4. Survey volume kendaraan dilakukan dengan cara menggunakan video. Pada persimpangan Jl.

Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul terdapat 4 pos kamera untuk survey *traffic counting* simpang.

c. Data Kondisi Lingkungan

Data kondisi lingkungan yang merupakan daerah di sekitar persimpangan, dimana lingkungan tersebut dapat mempengaruhi tingkat hambatan samping.

2. Data Sekunder

Data sekunder bersumber dari BPS dan DISHUB kota Surabaya, data yg didapat adalah:

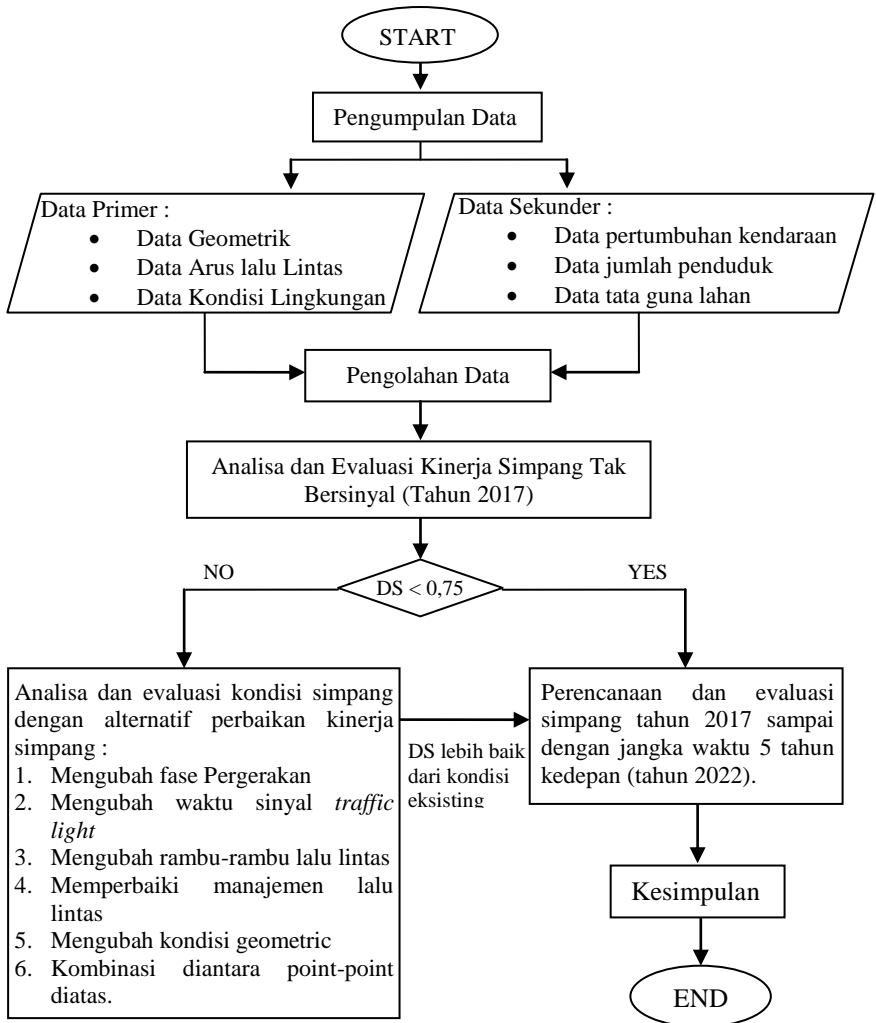

- a. Data jumlah pertumbuhan kendaraan kota Surabaya
- b. Data jumlah pertumbuhan penduduk kota Surabaya
- c. Data tata guna lahan di sekitar persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul.

3. Berdasarkan data - data yang diperoleh maka dapat dilakukan perhitungan kapasitas (C), tundaan (D), dan derajat kejenuhan (DS) maupun faktor perilaku yang berpengaruh terhadap kondisi lalu lintas persimpangan.
4. Selanjutnya dilakukan perbaikan kinerja simpang kondisi eksisting yang berupa tak bersinyal dengan melakukan beberapa alternatif evaluasi, yaitu:
 - a. Memperbaiki waktu sinyal traffic light
 - b. Memperbaiki manajemen lalu lintas
 - c. Mengubah fase pergerakan arus lalu lintas
 - d. Memperbaiki rambu lalu lintas
 - e. Mengubah kondisi geometrik jalan
 - f. Kombinasi dari point-point diatas.

5. Mengevaluasi kinerja perbaikan simpang kondisi eksisting (tahun 2017) hingga jangka waktu 5 tahun kedepan (tahun 2022).
6. Dengan selesainya analisa dan evaluasi persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul, maka dapat disimpulkan proses pengerjaan tugas akhir ini telah selesai.

BAB IV

PENGUMPULAN DAN PENGOLAHAN DATA

4.1 Pengumpulan Data

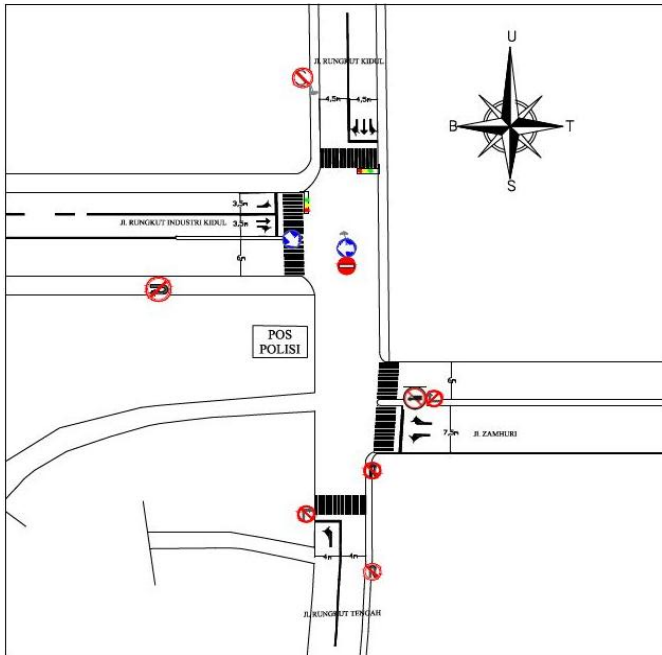

4.1.1 Data Primer

Data primer adalah data yang didapatkan dari pengamatan langsung di lapangan dengan melakukan kegiatan survey. Data-data yang diperoleh antara lain :

4.1.1.1 Data Geometrik Simpang

Hasil survey geometrik pada simpang tak bersinyal Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul dapat diuraikan sebagai berikut :

- a. Pendekat Utara Jl. Rungkut Kidul
 - Lebar Pendekat : 9 m
 - Lebar Masuk : 4,5 m
 - Lebar Keluar : 6 m
- b. Pendekat Selatan Jl. Rungkut Tengah
 - Lebar Pendekat : 8 m
 - Lebar Masuk : 4 m
 - Lebar Keluar : 6 m
- c. Pendekat Timur Jl. Zamhuri
 - Lebar Pendekat : 7,5 m
 - Lebar Masuk : 7,5 m
 - Lebar Keluar : 6 m
- d. Pendekat Barat Jl. Rungkut Industri Kidul
 - Lebar Pendekat : 7 m
 - Lebar Masuk : 7 m
 - Lebar Keluar : 6 m

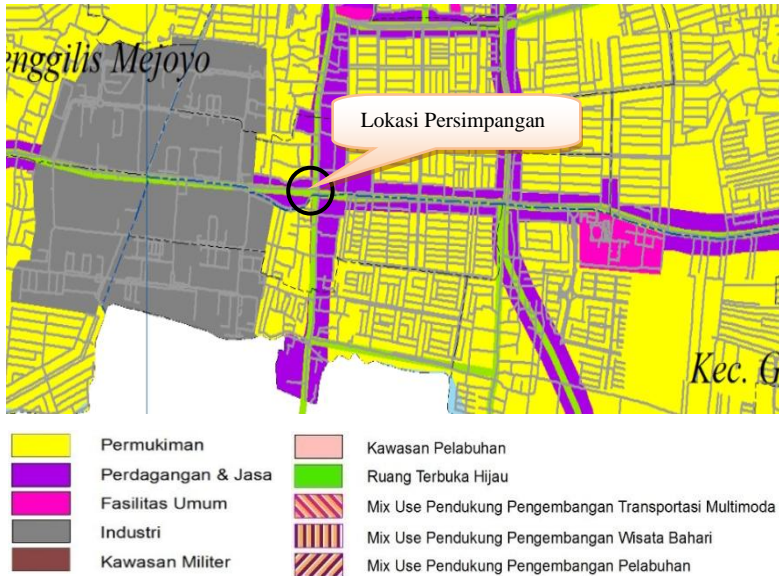

Gambar 4.1 Kondisi Geometrik Simpang Tak Bersinyal

4.1.1.2 Kondisi Eksisting Persimpangan

Persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya pada saat ini dikategorikan sebagai daerah komersial (pertokoan, perkantoran) dan permukiman. Pada pendekatan utara Jl. Rungkut Kidul dan pendekatan selatan Jl. Rungkut Tengah merupakan pertokoan dan pemukiman warga. Pada pendekatan barat Jl. Rungkut Industri Kidul merupakan akses jalan menuju daerah kawasan industry. Sedangkan pendekatan timur Jl. Zamhuri terdapat pelebaran jalan menggunakan box culvert yang dapat menimbulkan meningkatnya volume kendaraan di daerah persimpangan tersebut.

4.1.1.3 Kondisi Tata Guna Lahan Area Persimpangan

Kondisi tata guna lahan sekitar area persimpangan seperti pada **Gambar 4.2**

Gambar 4.2 Tata Guna Lahan Lokasi Persimpangan

4.1.1.4 Median

Pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul terdapat median hanya pada pendekatan Jl. Zamhuri berukuran 1 m dan pendekatan Jl. Rungkut Industri Kidul berukuran 0,5 m.

4.1.1.5 Tipe Lingkungan Jalan

Pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul didapat :

- Pendekat Utara Jl. Rungkut Kidul :
Daerah Pemukiman (RES) + Daerah Perdagangan dan Jasa (COM).

- b. Pendekat Selatan Jl. Rungkut Tengah :
Daerah Pemukiman (RES) + Daerah Perdagangan dan Jasa (COM).
- c. Pendekat Timur Jl. Zamhuri :
Daerah Pemukiman (RES) + Daerah Perdagangan dan Jasa (COM).
- d. Pendekat Barat Jl. Rungkut Industri Kidul :
Daerah Pemukiman (RES) + Daerah Perdagangan dan Jasa (COM).

4.1.1.6 Hambatan Samping

Pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul terdapat hambatan samping pada setiap pendekat, yaitu :

- a. Pendekat Utara Jl. Rungkut Kidul : Tinggi
- b. Pendekat Selatan Jl. Rungkut Tengah : Tinggi
- c. Pendekat Timur Jl. Zamhuri : Sedang
- d. Pendekat Barat Jl. Rungkut Industri Kidul : Tinggi

4.1.1.7 Data Volume Kendaraan pada Simpang pada Jam Puncak

Data-data volume kendaraan merupakan informasi dasar yang dibutuhkan untuk analisa eksisting dan perencanaan alternative perbaikan simpang. Survey dilakukan pada hari kerja (Selasa, 17 Januari 2017) dan hari libur (Sabtu, 21 Januari 2017) dengan 3 periode jam puncak yaitu puncak pagi (06.00 – 09.00), puncak siang (11.00 – 14.00), dan puncak sore (16.00 – 19.00). Rekapitulasi Data Volume Kendaraan dapat dilihat pada *Lampiran*.

4.1.2 Data Sekunder

Data sekunder diperoleh berdasarkan informasi dari pihak - pihak yang terkait. Data-data yang diperoleh antara lain :

4.1.2.1 Data Jumlah Kendaraan Terdaftar di Surabaya

Pertumbuhan lalu lintas dianggap sebanding dengan pertumbuhan kendaraan, dengan demikian dapat diartikan pertumbuhan lalu lintas dapat diestimasi dengan penambahan jumlah kendaraan. Data Jumlah Kendaraan terdaftar di Surabaya tercatat dalam **Tabel 4.1** dibawah ini :

Tabel 4.1 Data Jumlah Kendaraan Terdaftar di Surabaya

| Tahun | Mobil | Truk | Sepeda Motor |
|-------|---------|--------|--------------|
| | LV | HV | MC |
| 2009 | 1129870 | 264277 | 89124 |
| 2010 | 1213457 | 279116 | 91880 |
| 2011 | 1274660 | 275930 | 94622 |
| 2012 | 1402190 | 294780 | 103445 |
| 2013 | 1482115 | 311582 | 109342 |
| 2014 | 1566595 | 329343 | 115574 |
| 2015 | 1655891 | 348115 | 122162 |

Sumber : Badan Pusat Statistik Kota Surabaya, 2016

Data Jumlah Kendaraan diatas merupakan data sekunder yang digunakan untuk mencari nilai prosentase pertumbuhan kendaraan pada tiap tahunnya, kemudian hasil prosentase dikalikan dengan volume kendaraan dari hasil survey lapangan yang merupakan data primer.

4.1.2.2 Data Jumlah Penduduk di Surabaya

Data jumlah penduduk digunakan untuk menentukan factor penyesuaian ukuran kota. Data jumlah penduduk Kota Surabaya dapat dilihat dalam **Tabel 4.2** dibawah ini :

Tabel 4.2 Pertumbuhan Penduduk Kota Surabaya

| Tahun | Jml. Penduduk |
|---------------|-----------------|
| 2012 | 2765487 |
| 2013 | 3200454 |
| 2014 | 2853661 |
| 2015 | 2943528 |
| 2016 | 3016653 |
| Jumlah | 14779783 |

Sumber : Badan Pusat Statistik Surabaya, 2016

4.2 Pengolahan Data

4.2.1 Pengolahan Data Volume Lalu Lintas Persimpangan

Perhitungan volume kendaraan dimulai dengan merekapitulasi hasil survey *traffic counting*. Contoh perhitungan rekapitulasi untuk weekday Selasa, 17 Januari 2017 jam puncak siang simpang tak bersinyal pada pendekatan Utara pergerakan LT dapat dilihat pada **Tabel 4.3**.

Tabel 4.3 Data Survey Traffic Counting

| WAKTU | Jumlah Kendaraan / 5 Menit | | | | Volume Kendaraan (kend/jam) | | | | Volume Kendaraan (smp/jam) | | | |
|---------------|-------------------------------|-----|-----|----|--------------------------------|----|-----|----|-------------------------------|----|-----|-------|
| | LV | HV | MC | UM | LV | HV | MC | UM | LV | HV | MC | TOTAL |
| | 1 | 1.3 | 0.5 | | | | | | | | | |
| 11.00 - 11.05 | 34 | 4 | 44 | 1 | | | | | | | | |
| 11.05 - 11.10 | 29 | 6 | 41 | 1 | | | | | | | | |
| 11.10 - 11.15 | 26 | 4 | 43 | 1 | | | | | | | | |
| 11.15 - 11.20 | 27 | 3 | 46 | 0 | | | | | | | | |
| 11.20 - 11.25 | 25 | 4 | 44 | 2 | | | | | | | | |
| 11.25 - 11.30 | 28 | 3 | 36 | 0 | | | | | | | | |
| 11.30 - 11.35 | 25 | 6 | 27 | 1 | | | | | | | | |
| 11.35 - 11.40 | 24 | 5 | 30 | 0 | | | | | | | | |
| 11.40 - 11.45 | 29 | 3 | 33 | 0 | | | | | | | | |
| 11.45 - 11.50 | 31 | 5 | 34 | 1 | | | | | | | | |
| 11.50 - 11.55 | 27 | 3 | 37 | 1 | | | | | | | | |
| 11.55 - 12.00 | 22 | 1 | 35 | 1 | 327 | 47 | 450 | 9 | 327 | 61 | 225 | 613 |
| 12.00 - 12.05 | 16 | 2 | 31 | 1 | 309 | 45 | 437 | 9 | 309 | 59 | 219 | 586 |

Sumber : Survey Traffic Counting dan Hasil Perhitungan

Dari hasil survey dengan periode waktu setiap 5 menit, selanjutnya dilakukan perhitungan kendaraan perjam, contoh perhitungan volume kend/jam untuk rentang waktu pukul 11.00 – 12.00 sebagai berikut :

$$\begin{aligned}\text{LV} &= \Sigma \text{LV kend/5menit mulai pukul 11.00 – 12.00} \\ &= 34 + 29 + 26 + 27 + 25 + 28 + 25 + 24 + 29 + \\ &\quad 31 + 27 + 22 \\ &= 327 \text{ kend/jam.}\end{aligned}$$

Begitu pula untuk perhitungan volume HV, MC, dan UM. Selanjutnya dilakukan perhitungan volume kendaraan smp/jam.

Factor emp untuk simpang tak bersinyal :

- LV (Kendaraan Ringan) : 1,0
- HV (Kendaraan Berat) : 1,3
- MC (Sepeda Motor) : 0,5

Perhitungan volume untuk rentang waktu 11.00 – 12.00

$$\begin{aligned}\text{LV} &= 327 \text{ kend/jam} \times \text{factor emp LV} \\ &= 327 \times 1,0 \\ &= 327 \text{ smp/jam}\end{aligned}$$

$$\begin{aligned}\text{HV} &= 47 \text{ kend/jam} \times \text{faktor emp HV} \\ &= 47 \times 1,3 \\ &= 61 \text{ smp/jam}\end{aligned}$$

$$\begin{aligned}\text{MC} &= 450 \text{ kend/jam} \times \text{factor emp MC} \\ &= 450 \times 0,5 \\ &= 225 \text{ smp/jam}\end{aligned}$$

Dari hasil perhitungan volume smp/jam kemudian dilakukan penjumlahan volume smp/jam kendaraan LV, HV, dan MC.

Perhitungan volume kendaraan smp/jam untuk rentang waktu 11.00 – 12.00.

$$\begin{aligned}
 \text{Total} &= \Sigma \text{ Volume LV, HV, MC (smp/jam)} \\
 &\quad \text{pukul 11.00 – 12.00} \\
 &= 327 + 61 + 225 \\
 &= 613 \text{ smp/jam}
 \end{aligned}$$

Begitu pula untuk perhitungan volume LV, HV, dan MC di jam berikutnya.

Hasil total kendaraan smp/jam masing-masing titik survey dari keseluruhan 10 pergerakan direkapitulasi sesuai rentang waktu per jam kemudian dijumlahkan, sehingga akan diketahui jam puncak simpang tak bersinyal. Rekapitulasi dapat dilihat pada **Tabel 4.4**. Jam puncak siang weekday simpang tak bersinyal adalah pukul 12.40 – 13.40.

Tabel 4.4 Rekapitulasi Survey Traffic Counting

| WAKTU | VOLUME KENDARAAN (smp/jam) | | | | | | | | | | TOTAL VOLUME smp/jam |
|---------------|----------------------------|-----|-----|----|-----|----|------|-----|-----|-----|----------------------------|
| | PERGERAKAN | | | | | | | | | | |
| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | |
| 11.00 - 12.00 | 613 | 753 | 102 | 16 | 381 | 14 | 1095 | 346 | 611 | 768 | 4684 |
| 11.05 - 12.05 | 586 | 792 | 104 | 19 | 381 | 15 | 1112 | 356 | 626 | 774 | 4750 |
| 11.10 - 12.10 | 569 | 817 | 103 | 20 | 397 | 12 | 1123 | 367 | 643 | 789 | 4828 |
| 11.15 - 12.15 | 555 | 831 | 106 | 19 | 402 | 12 | 1125 | 375 | 669 | 797 | 4877 |
| 11.20 - 12.20 | 540 | 842 | 114 | 20 | 400 | 12 | 1126 | 388 | 688 | 802 | 4919 |
| 11.25 - 12.25 | 530 | 848 | 115 | 18 | 395 | 11 | 1127 | 401 | 711 | 790 | 4934 |

| 12.55 - 13.55 | 634 | 754 | 116 | 21 | 301 | 18 | 1377 | 421 | 774 | 770 | 5166 |
| 13.00 - 14.00 | 626 | 735 | 116 | 22 | 305 | 19 | 1402 | 419 | 768 | 764 | 5156 |

Sumber : Hasil Perhitungan

Setelah diketahui rentang waktu jam puncak siang, maka volume kendaraan perjam yang digunakan untuk perhitungan analisa simpang tak bersinyal adalah volume kend/jam pada rentang waktu tersebut pada tiap pergerakan.

Tabel 4.5 Rekapitulasi Volume kend/jam Weekday Puncak Siang

| WAKTU | Jumlah Kendaraan / 5 Menit | | | | Volume Kendaraan (kend/jam) | | | | Volume Kendaraan (smp/jam) | | | |

4.2.2 Pengolahan Data Jumlah Kendaraan di Surabaya

Dalam melakukan prediksi terhadap pertumbuhan kapasitas kendaraan di tahun yang akan datang dilakukan dengan metode Analisa Regesi Linier. Dalam menentukan pertumbuhan kendaraan menggunakan regresi linier, data jumlah kendaraan yang harus didapatkan minimal satu tahun terakhir. Data yang diperoleh adalah data selama 7 tahun terakhir (2009-2015).

1. Pertumbuhan Sepeda Motor (MC)

Pertumbuhan sepeda motor dapat dilihat dalam **Tabel 4.8** dibawah ini :

Tabel 4.8 Pertumbuhan Sepeda Motor (MC)

| Tahun | Sepeda Motor (MC) |
|---------------|-------------------|
| 2009 | 1129870 |
| 2010 | 1213457 |
| 2011 | 1274660 |
| 2012 | 1402190 |
| 2013 | 1482115 |
| 2014 | 1566595 |
| 2015 | 1655891 |
| Jumlah | 9724778 |

Sumber : Badan Pusat Statistik Surabaya, 2016

Hasil analisa regresi menggunakan Microsoft Excel dapat dilihat pada gambar berikut :

Gambar 4.3 Regresi Pertumbuhan MC

Dari hasil analisa regresi jumlah sepeda motor diperoleh persamaan :

$$y = 88,992.643x - 177,663,943.429$$

$$R^2 = 0.996$$

1. Langkah perhitungan regresi pertumbuhan MC tahun 2016 :

Nilai $x = 2016$

$$y = 88,992.643x - 177,663,943.429$$

$$y = 88,992.643 (2016) - 177,663,943.429$$

$$y = 1745225$$

2. Langkah perhitungan factor pertumbuhan MC tahun 2016 :

$$i = (y_2 - y_1) / y_1 \times 100\%$$

$$i = (1745225 - 1655891) / 1655891 \times 100\%$$

$$i = 5.39\%$$

Hasil perhitungan tahun-tahun berikutnya dapat dilihat pada **Tabel 4.9** :

Tabel 4.9 Hasil Perhitungan Regresi Pertumbuhan Sepeda Motor (MC) dan Factor Pertumbuhan MC

| No. | Tahun | Nilai y | i (%) |
|-----|-------|---------|-------|
| 1 | 2009 | 1129870 | |
| 2 | 2010 | 1213457 | 7.40 |
| 3 | 2011 | 1274660 | 5.04 |
| 4 | 2012 | 1402190 | 10.01 |
| 5 | 2013 | 1482115 | 5.70 |
| 6 | 2014 | 1566595 | 5.70 |
| 7 | 2015 | 1655891 | 5.70 |
| 8 | 2016 | 1745225 | 5.39 |
| 9 | 2017 | 1834218 | 5.10 |
| 10 | 2018 | 1923210 | 4.85 |
| 11 | 2019 | 2012203 | 4.63 |
| 12 | 2020 | 2101195 | 4.42 |
| 13 | 2021 | 2190188 | 4.24 |
| 14 | 2022 | 2279181 | 4.06 |

Sumber : Hasil Perhitungan

3. Langkah perhitungan pertumbuhan jumlah kendaraan MC tahun 2018 :

| PENDEKAT | ARAH | KENDARAAN / JAM | | | |
|--------------------------|------|-----------------|----|------|----|
| | | LV | HV | MC | UM |
| Weekday 2017 Puncak Pagi | | | | | |
| Jl. Rungkut Kidul | LT | 32 | 0 | 113 | 15 |
| | ST | 235 | 4 | 1115 | 20 |
| | RT | 497 | 8 | 1896 | 20 |

$$\begin{aligned}
 V_{MC \text{ 2018}} &= \left(\frac{i\% \text{ 2018} \times V_{MC \text{ 2017}}}{100\%} \right) + V_{MC \text{ 2017}} \\
 &= \left(\frac{4,85 \times 113}{100\%} \right) + 113 \\
 &= 119 \text{ kend/jam}
 \end{aligned}$$

Begitu pula untuk perhitungan volume LV, HV, dan MC di 5 tahun berikutnya. Rekapitulasi dapat dilihat pada *Lampiran*.

2. Pertumbuhan Kendaraan Penumpang (LV)

Pertumbuhan mobil penumpang dapat dilihat dalam Tabel 4.10 dibawah ini :

Tabel 4.10 Pertumbuhan Kendaraan Penumpang (LV)

| Tahun | Mobil (LV) |
|---------------|----------------|
| 2009 | 264277 |
| 2010 | 279116 |
| 2011 | 275930 |
| 2012 | 294780 |
| 2013 | 311582 |
| 2014 | 329343 |
| 2015 | 348115 |
| Jumlah | 2103143 |

Sumber : Badan Pusat Statistik Surabaya, 2016

Hasil analisa regresi menggunakan Microsoft Excel dapat dilihat pada gambar berikut :

Gambar 4.4 Regresi Pertumbuhan LV

Dari hasil analisa regresi jumlah mobil penumpang diperoleh persamaan :

$$y = 13,843.571x - 27,552,816.714$$

$$R^2 = 0.954$$

1. Langkah perhitungan regresi pertumbuhan LV tahun 2016 :

Nilai $x = 2016$

$$y = 13,843.571x - 27,552,816.714$$

$$y = 13,843.571 (2016) - 27,552,816.714$$

$$y = 355822$$

2. Langkah perhitungan factor pertumbuhan LV tahun 2016 :

$$i = (y_2 - y_1) / y_1 \times 100\%$$

$$i = (355822 - 348115) / 348115 \times 100\%$$

$$i = 2.21\%$$

Hasil perhitungan tahun-tahun berikutnya dapat dilihat pada **Tabel 4.11** :

Tabel 4.11 Hasil Perhitungan Regresi Pertumbuhan Mobil Penumpang (LV) dan Factor Pertumbuhan LV

| No. | Tahun | Nilai y | i (%) |
|-----|-------|---------|-------|
| 1 | 2009 | 264277 | |
| 2 | 2010 | 279116 | 5.61 |
| 3 | 2011 | 275930 | -1.14 |
| 4 | 2012 | 294780 | 6.83 |
| 5 | 2013 | 311582 | 5.70 |
| 6 | 2014 | 329343 | 5.70 |
| 7 | 2015 | 348115 | 5.70 |
| 8 | 2016 | 355822 | 2.21 |
| 9 | 2017 | 369666 | 3.89 |
| 10 | 2018 | 383510 | 3.74 |
| 11 | 2019 | 397353 | 3.61 |
| 12 | 2020 | 411197 | 3.48 |
| 13 | 2021 | 425040 | 3.37 |
| 14 | 2022 | 438884 | 3.26 |

Sumber : Hasil Perhitungan

3. Pertumbuhan Kendaraan Berat (HV)

Pertumbuhan kendaraan berat dapat dilihat dalam **Tabel 4.12** dibawah ini :

Tabel 4.12 Pertumbuhan Kendaraan Berat (HV)

| Tahun | Truk/Bus (HV) |
|---------------|---------------|
| 2009 | 89124 |
| 2010 | 91880 |
| 2011 | 94622 |
| 2012 | 103445 |
| 2013 | 109342 |
| 2014 | 115574 |
| 2015 | 122162 |
| Jumlah | 726149 |

Sumber : Badan Pusat Statistik Surabaya, 2016

Hasil analisa regresi menggunakan Microsoft Excel dapat dilihat pada gambar berikut :

Gambar 4.5 Regresi Pertumbuhan HV

Dari hasil analisa regresi jumlah kendaraan berat diperoleh persamaan :

$$y = 5,757.929x - 11,481,216.714$$

$$R^2 = 0.979$$

1. Langkah perhitungan regresi pertumbuhan HV tahun 2016 :

Nilai $x = 2016$

$$y = 5,757.929x - 11,481,216.714$$

$$y = 5,757.929 (2016) - 11,481,216.714$$

$$y = 126768$$

2. Langkah perhitungan factor pertumbuhan HV tahun 2016 :

$$i = (y_2 - y_1) / y_1 \times 100\%$$

$$i = (126768 - 122162) / 122162 \times 100\%$$

$$i = 3.77 \%$$

Hasil perhitungan tahun-tahun berikutnya dapat dilihat pada **Tabel 4.13** :

Tabel 4.13 Hasil Perhitungan Regresi Pertumbuhan Kendaraan Berat (HV) dan Factor Pertumbuhan HV

| No. | Tahun | Nilai y | i (%) |
|-----|-------|---------|-------|
| 1 | 2009 | 89124 | |
| 2 | 2010 | 91880 | 3.09 |
| 3 | 2011 | 94622 | 2.98 |
| 4 | 2012 | 103445 | 9.32 |
| 5 | 2013 | 109342 | 5.70 |
| 6 | 2014 | 115574 | 5.70 |
| 7 | 2015 | 122162 | 5.70 |
| 8 | 2016 | 126768 | 3.77 |
| 9 | 2017 | 132526 | 4.54 |
| 10 | 2018 | 138284 | 4.34 |
| 11 | 2019 | 144042 | 4.16 |
| 12 | 2020 | 149800 | 4.00 |
| 13 | 2021 | 155558 | 3.84 |
| 14 | 2022 | 161316 | 3.70 |

Sumber : Hasil Perhitungan

4.2.3 Analisa Pertumbuhan Penduduk Kota Surabaya

Data Jumlah Penduduk Kota Surabaya dapat dilihat dalam **Tabel 4.14** dibawah ini :

Tabel 4.14 Pertumbuhan Penduduk Kota Surabaya

| Tahun | Jml. Penduduk |
|---------------|-----------------|
| 2012 | 2765487 |
| 2013 | 3200454 |
| 2014 | 2853661 |
| 2015 | 2943528 |
| 2016 | 3016653 |
| Jumlah | 14779783 |

Sumber : Badan Pusat Statistik Surabaya, 2016

Hasil analisa regresi menggunakan Microsoft Excel dapat dilihat pada gambar berikut :

Gambar 4.6 Regresi Pertumbuhan Penduduk

Dari hasil analisa regresi jumlah penduduk diperoleh persamaan :

$$y = 24,540.60 x - 46,468,811.80$$

$$R^2 = 0.05$$

1. Langkah perhitungan regresi pertumbuhan MC tahun 2016 :

Nilai $x = 2017$

$$y = 24,540.60 x - 46,468,811.80$$

$$y = 24,540.60 (2017) - 46,468,811.80$$

$$y = 3029578$$

Hasil perhitungan tahun-tahun berikutnya dapat dilihat pada **Tabel 4.15** :

Tabel 4.15 Hasil Perhitungan Regresi Pertumbuhan Penduduk
Kota Surabaya

| No. | Tahun | Nilai y |
|-----|-------|---------|
| 1 | 2012 | 2765487 |

| 11 | 2022 | 3152281 |

Sumber : Hasil Perhitungan

BAB V

ANALISA KINERJA EKSISTING SIMPANG TAK BERSINYAL

5.1 Kondisi Eksisting Persimpangan

Persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya pada saat ini dikategorikan sebagai daerah komersial (pertokoan, perkantoran) dan permukiman. Pada pendekat utara Jl. Rungkut Kidul dan pendekat selatan Jl. Rungkut Tengah merupakan pertokoan dan permukiman warga. Pada pendekat barat Jl. Rungkut Industri Kidul merupakan akses jalan menuju daerah kawasan industri. Sedangkan pendekat timur Jl. Zamhuri terdapat pelebaran jalan menggunakan box culvert yang dapat menimbulkan meningkatnya volume kendaraan di daerah persimpangan tersebut.

5.2 Kondisi Geometrik Simpang

Hasil survey geometrik pada simpang tak bersinyal Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul dapat diuraikan sebagai berikut :

- a. Pendekat Utara Jl. Rungkut Kidul
 - Lebar Pendekat : 9 m
 - Lebar Masuk : 4,5 m
 - Lebar Keluar : 6 m
- b. Pendekat Selatan Jl. Rungkut Tengah
 - Lebar Pendekat : 8 m
 - Lebar Masuk : 4 m
 - Lebar Keluar : 6 m
- c. Pendekat Timur Jl. Zamhuri
 - Lebar Pendekat : 7,5 m
 - Lebar Masuk : 7,5 m
 - Lebar Keluar : 6 m

d. Pendekat Barat Jl. Rungkut Industri Kidul

- Lebar Pendekat : 7 m
- Lebar Masuk : 7 m
- Lebar Keluar : 6 m

Gambar 5.1 Kondisi Geometrik Simpang Tak Bersinyal

5.3 Median

Pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul terdapat median hanya pada pendekat Jl. Zamhuri berukuran 1 m dan pendekat Jl. Rungkut Industri Kidul berukuran 0,5 m.

5.4 Tipe Lingkungan Jalan

Pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul didapat :

- a. Pendekat Utara Jl. Rungkut Kidul :
Daerah Pemukiman (RES) + Daerah Perdagangan dan Jasa (COM).
- b. Pendekat Selatan Jl. Rungkut Tengah :
Daerah Pemukiman (RES) + Daerah Perdagangan dan Jasa (COM).
- c. Pendekat Timur Jl. Zamhuri :
Daerah Pemukiman (RES) + Daerah Perdagangan dan Jasa (COM).
- d. Pendekat Barat Jl. Rungkut Industri Kidul :
Daerah Pemukiman (RES) + Daerah Perdagangan dan Jasa (COM).

5.5 Hambatan Samping

Pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul terdapat hambatan samping pada setiap pendekat, yaitu :

- a. Pendekat Utara Jl. Rungkut Kidul : Tinggi
- b. Pendekat Selatan Jl. Rungkut Tengah : Tinggi
- c. Pendekat Timur Jl. Zamhuri : Sedang
- d. Pendekat Barat Jl. Rungkut Industri Kidul : Tinggi

5.6 Analisa Kinerja Simpang Tak Bersinyal Weekday Puncak Siang

5.6.1 Kapasitas Dasar (Co)

- Jalan Mayor (Jl. Zamhuri – Jl. Rungkut Industri Kidul)

$$W \text{ Mayor} = (7,5 \text{ m} + 7 \text{ m}) / 2$$

$$= 7,25 \text{ m} > 5,5 \text{ m}$$
- Jalan Minor (Jl. Rungkut Kidul – Jl. Rungkut Tengah)

$$W \text{ Minor} = ((9 \text{ m} / 2) + (8 \text{ m} / 2)) / 2$$

$$= 4,25 \text{ m} < 5,5 \text{ m}$$

Maka jumlah lajur pendekat mayor = 4 lajur 2 arah dan untuk pendekat minor = 2 lajur 2 arah. Didapat tipe simpang yairu 424 (4 lengan, 4 lajur mayor, 2 lajur minor).

Nilai kapasitas dasar diperoleh menggunakan **Tabel 5.1**. Variabel masukan adalah tipe simpang pada lokasi studi yang mempunyai tipe 424.

Tabel 5.1 Kapasitas Dasar Menurut Tipe Simpang

| Tipe simpang IT | Kapasitas dasar (smp/jam) |
|------------------------|--------------------------------------|
| 322 | 2700 |
| 342 | 2900 |
| 324 atau 344 | 3200 |
| 422 | 2900 |
| 424 atau 444 | 3400 |

Sumber : MKJI 1997

Jadi, kapasitas dasar pada simpang ini adalah 3400 smp/jam.

5.6.2 Faktor Penyesuaian Lebar Pendekat (Fw)

Faktor penyesuaian lebar pendekat untuk tipe simpang 424 diperoleh dari grafik dan persamaan pada **Gambar 5.2** :

$$\begin{aligned}
 W_1 &= \text{Lebar Rata-Rata Pendekat} \\
 &= (9 \text{ m} / 2 + 7,5 \text{ m} + 8 \text{ m} / 2 + 7 \text{ m}) / 4 \\
 &= 5,75 \text{ m}
 \end{aligned}$$

$$\begin{aligned}
 Fw &= 0,61 + 0,0740 \cdot 5,75 \text{ m} \\
 &= 1,036
 \end{aligned}$$

Gambar 5.2 Faktor Penyesuaian Lebar Pendekat (F_w)

5.6.3 Faktor Penyesuaian Median Jalan Utama (F_M)

Faktor penyesuaian median jalan utama diperoleh menggunakan **Tabel 5.2**. Fator penyesuaian hanya digunakan untuk jalan utama dengan 2 jalur. Variabel masukan adalah tipe median jalan utama.

Tabel 5.2 Faktor Penyesuaian Median Jalan Utama (F_M)

| Uraian | Tipe M | Faktor penyesuaian median, (F_M) |
|--|-----------|--------------------------------------|
| Tidak ada median jalan utama | Tidak ada | 1 |
| Ada median jalan utama, lebar <3m | Sempit | 1.05 |
| Ada median jalan utama, lebar ≥ 3 m | Lebar | 1.2 |

Sumber : MKJI 1997

Maka dari tabel diatas, $F_M = 1,05$ karena pada simpang tersebut terdapat median pada jalan utama pada Jl. Zamhuri dengan lebar 1 m dan pada Jl. Rungkut Industri Kidul dengan lebar 0,5 m .

5.6.4 Faktor Penyesuaian Ukuran Kota (F_{CS})

Berdasarkan jumlah penduduk kota Surabaya pada **Tabel 4.9** Hasil Perhitungan Regresi Pertumbuhan Penduduk Kota Surabaya, menunjukkan jumlah penduduk kota Surabaya Tahun 2017 sebesar 3.029.578 jiwa. Kemudian dari jumlah tersebut dicari nilai koefisiennya pada **Tabel 5.3** dan di dapat $F_{CS} = 1,05$.

Tabel 5.3 Faktor Penyesuaian Ukuran Kota

| Ukuran kota | Penduduk (juta) | Faktor penyesuaian ukuran kota (F_{CS}) |
|--------------|-----------------|---|
| Sangat kecil | <0,1 | 0.82 |
| Kecil | 0,1-0,5 | 0.88 |
| Sedang | 0,5-1,0 | 0.94 |
| Besar | 1,0-3,0 | 1 |
| Sangat besar | >3,0 | 1.05 |

Sumber : MKJI 1997

5.6.5 Faktor Penyesuaian Tipe Lingkungan Jalan, Hambatan Samping, dan Kendaraan Tak Bermotor (F_{RSU})

Faktor Penyesuaian Tipe Lingkungan Jalan, Hambatan Samping, dan Kendaraan Tak Bermotor (F_{RSU}) dihitung menggunakan **Tabel 5.4** Faktor Penyesuaian Tipe Lingkungan Jalan, Hambatan Samping, dan Kendaraan Tak Bermotor (F_{RSU}). Variable masukan adalah tipe jalan (RE), kelas hambatan samping (SF), dan rasio kendaraan tak bermotor (UM/MV).

| Pendekat | Volume MV (kend/jam) | Volume UM (kend/jam) |
|---|-------------------------|-------------------------|
| A (Jl. Rungkut Kidul) | 2440 | 44 |
| B (Jl. Rungkut Tengah) | 2210 | 30 |
| C (Jl. Zamhuri) | 625 | 27 |
| D (Jl. Rungkut Industri Kidul) | 3108 | 35 |
| Volume Total Kend. Yang Masuk Simpang (kend/jam) | 8383 | 136 |

Sumber : Hasil Survey Counting

$$\begin{aligned}
 P_{UM} &= \frac{Q_{TOTAL} \text{ UM (kend/jam)}}{Q_{TOTAL} \text{ MV (kend/jam)}} \\
 &= \frac{136}{8383} \\
 &= 0,016
 \end{aligned}$$

Tabel 5.4 Faktor Penyesuaian Tipe Lingkungan Jalan, Hambatan Samping, dan Kendaraan Tak Bermotor (F_{RSU})

| Kelas tipe lingkungan jalan RE | Kelas hambatan samping SF | Rasio kendaraan tak bermotor P_{UM} | | | | | |
|--------------------------------|---------------------------|---------------------------------------|------|------|------|------|------|
| | | 0,00 | 0,05 | 0,10 | 0,15 | 0,20 | 0,25 |
| Komersial | Tinggi | 0.93 | 0.88 | 0.84 | 0.79 | 0.74 | 0.7 |
| | Sedang | 0.94 | 0.89 | 0.85 | 0.8 | 0.75 | 0.7 |
| | Rendah | 0.95 | 0.9 | 0.86 | 0.81 | 0.76 | 0.71 |
| Permukiman | Tinggi | 0.96 | 0.91 | 0.86 | 0.82 | 0.77 | 0.72 |
| | Sedang | 0.97 | 0.92 | 0.87 | 0.82 | 0.77 | 0.73 |
| | Rendah | 0.98 | 0.93 | 0.88 | 0.83 | 0.78 | 0.74 |
| Akses terbatas | Tinggi/sedang/ rendah | 1 | 0.95 | 0.9 | 0.85 | 0.8 | 0.75 |

Sumber : MKJI 1997

| RASIO | F_{RSU} |
|-------|-----------|
| 0.00 | 0.93 |
| 0.016 | X |
| 0.05 | 0.88 |

$$\begin{aligned}
 X &= 0,88 - \{(0,05 - 0,016 / 0,05 - 0,00) \times (0,88 - 0,93)\} \\
 &= 0,914
 \end{aligned}$$

Jadi, nilai F_{RSU} adalah 0,914.

5.6.6 Faktor Penyesuaian Belok Kiri (F_{LT})

Faktor Penyesuaian Belok Kiri (F_{LT}) dapat diuraikan sebagai berikut.

| Pendekat | Volume Kendaraan (smp/jam) | | | Volume Kend. Total (smp/jam) |
|---|-------------------------------|-----|-----|---------------------------------|
| | LT | ST | RT | |
| A (Jl. Rungkut Kidul) | 117 | 796 | 651 | 1564 |
| B (Jl. Rungkut Tengah) | 1326 | 0 | 15 | 1341 |
| C (Jl. Zamhuri) | 307 | 20 | 0 | 327 |
| D (Jl. Rungkut Industri Kidul) | 764 | 783 | 431 | 1978 |
| Volume Total Kend. Yang Masuk Simpang (smp/jam) | | | | 5210 |

Sumber : Hasil Survey Counting

$$\begin{aligned}
 P_{LT} &= \frac{A_{LT} + B_{LT} + C_{LT} + D_{LT}}{\Sigma A + \Sigma B + \Sigma C + \Sigma D} \\
 &= \frac{117 + 1326 + 307 + 764}{5210} \\
 &= 0,483
 \end{aligned}$$

$$\begin{aligned}
 F_{LT} &= 0,84 + 1,6 \cdot P_{LT} \\
 &= 0,84 + 1,6 \cdot (0,48) \\
 &= 1,613
 \end{aligned}$$

5.6.7 Faktor Penyesuaian Belok Kanan (F_{RT})

Faktor Penyesuaian Belok Kanan ditentukan dari grafik dan persamaan pada **Gambar 5.3** dan didapat dari batas nilai yang diberikan untuk P_{RT} pada gambar adalah rentan dasar empiris dari manual. Untuk simpang 4 lengan $F_{RT} = 1,0$.

Gambar 5.3 Faktor Penyesuaian Belok Kanan (F_{RT})

5.6.8 Faktor Penyesuaian Rasio Arus Jalan Minor (F_{MI})

Faktor Penyesuaian rasio arus jalan minor ditentukan menggunakan **Tabel 5.5** sesuai dengan tipe simpang yaitu IT 424 kemudian diplot pada **Gambar 5.4**.

Tabel 5.5 Faktor Penyesuaian Jalan Minor (F_{MI})

| IT | F_{MI} | P_{MI} |
|-----|---|----------|
| 422 | $1,19xp_{MI}^2 - 1,19xp_{MI} + 1,19$ | 0,1-0,9 |
| 424 | $16,6xp_{MI}^4 - 33,5xp_{MI}^3 + 25,3xp_{MI}^2 - 8,6xp_{MI} + 1,95$ | 0,1-0,3 |
| 444 | $1,11xp_{MI}^2 - 1,11xp_{MI} + 1,11$ | 0,3-0,9 |
| 322 | $1,19xp_{MI}^2 - 1,19xp_{MI} + 1,19$ | 0,1-0,5 |
| | $-0,595xp_{MI}^2 + 0,595xp_{MI}^3 + 0,74$ | 0,5-0,9 |
| 342 | $1,19xp_{MI}^2 - 1,19xp_{MI} + 1,19$ | 0,1-0,5 |
| | $2,38xp_{MI}^2 - 2,38xp_{MI} + 1,49$ | 0,5-0,9 |
| 324 | $16,6xp_{MI}^4 - 33,3xp_{MI}^3 + 25,3xp_{MI}^2 - 8,6xp_{MI} + 1,95$ | 0,1-0,3 |
| 344 | $1,11xp_{MI}^2 - 1,11xp_{MI} + 1,11$ | 0,3-0,5 |
| | $-0,555xp_{MI}^2 + 0,555xp_{MI} + 0,69$ | 0,5-0,9 |

Sumber : MKJI 1997

$$\begin{aligned}
 P_{MI} &= \frac{\Sigma A + \Sigma B}{\Sigma A + \Sigma B + \Sigma C + \Sigma D} \\
 &= \frac{1564 + 1341}{5210} \\
 &= 0,558
 \end{aligned}$$

$$\begin{aligned}
 F_{MI} &= 16,6 \times P_{MI}^4 - 33,3 \times P_{MI}^3 + 25,3 \times P_{MI}^2 - 8,6 \times P_{MI} + 1,95 \\
 &= 16,6 \times (0,558)^4 - 33,3 \times (0,558)^3 + 25,3 \times (0,558)^2 - 8,6 \times (0,558) + 1,95 \\
 &= 0,84
 \end{aligned}$$

Gambar 5.4 Faktor Penyesuaian Jalan Minor (F_{MI})

5.6.9 Kapasitas (C)

Kapasitas dihitung dengan persamaan 2.10 dimana berbagai factornya sudah diketahui dari perhitungan diatas.

$$\begin{aligned}
 C &= C_o \times F_w \times F_M \times F_{CS} \times F_{RSU} \times F_{LT} \times F_{RT} \times F_{MI} \\
 &= 3400 \times 1,036 \times 1,05 \times 1,05 \times 0,914 \times 1,613 \times 1 \times 0,84 \\
 &= 4806 \text{ smp/jam}
 \end{aligned}$$

5.6.10 Perilaku Lalu Lintas

5.6.10.1 Derajat Kejenuhan (DS)

Derajat kejenuhan dihitung dengan persamaan 2.11. Diketahui arus total weekday puncak siang $Q_{tot} = 5210$ smp/jam.

$$\begin{aligned}
 DS &= \frac{Q_{total}}{C} \\
 &= \frac{5210 \text{ smp/jam}}{4806 \text{ smp/jam}} \\
 &= 1,08
 \end{aligned}$$

5.6.10.2 Tundaan Lalu Lintas Simpang (DT_I)

Tundaan lalu lintas simpang ditentukan menggunakan grafik dan persamaan pada **Gambar 5.5**.

$$\begin{aligned} DT_I &= 1,0504 / (0,2742 - 0,2042 \times DS) - (1 - DS) \times 2 \\ &= 1,0504 / (0,2742 - 0,2042 \times 1,08) - (1 - 1,08) \times 2 \\ &= 20,05 \text{ det/smp} \end{aligned}$$

Gambar 5.5 Tundaan Lalu Lintas Simpang

5.6.10.3 Tundaan Lalu Lintas Jalan Utama (DT_{MA})

Tundaan lalu lintas jalan utama ditentukan dari kurva empiris antara DT_{MA} dan DS . Lihat rumus pada **Gambar 5.6**.

$$\begin{aligned} DT_{MA} &= 1,05034 / (0,346 - 0,246 \times DS) - (1 - DS) \times 1,8 \\ &= 1,05034 / (0,346 - 0,246 \times 1,08) - (1 - 1,08) \times 1,8 \\ &= 13,39 \text{ det/smp} \end{aligned}$$

Gambar 5.6 Tundaan Lalu Lintas Jalan Utama (DT_{MA})

5.6.10.4 Tundaan Lalu Lintas Jalan Minor (DT_{MI})

Diketahui volume kendaraan weekday puncak siang sebagai berikut :

$$Q_{total} = 5210 \text{ smp/jam}$$

$$Q_{MA} = 2305 \text{ smp/jam}$$

$$Q_{MI} = 2905 \text{ smp/jam}$$

Tundaan lalu lintas jalan minor rata-rata :

$$\begin{aligned} DT_{MI} &= (Q_{total} \times DT_I - Q_{MA} \times DT_{MA}) / Q_{MI} \\ &= (5210 \times 20,05 - 2305 \times 13,39) / 2905 \\ &= 25.33 \text{ det/jam} \end{aligned}$$

5.6.10.5 Tundaan Geometrik Simpang (DG)

Tundaan geometrik simpang adalah tundaan geometrik rata-rata seluruh kendaraan bermotor yang masuk simpang. Tundaan geometric simpang dihitung dengan ketentuan sebagai berikut :

- Untuk $DS < 1,0$:

$$DG = (1 - DS) \times (P_T \times 6 + (1 - P_T) \times 3) + DS \times 4$$
- Untuk $DS \geq 1,0$:

$$DG = 4$$

Derajat kejenuhan simpang yaitu 1,08, maka $DG = 4$.

5.6.10.6 Tundaan Simpang (D)

Tundaan simpang ditentukan dari persamaan 2.14

$$\begin{aligned} D &= DG + DT_1 \\ &= 4 + 20,05 \\ &= 24,05 \text{ det/smp} \end{aligned}$$

5.6.10.7 Peluang Antrian (QP%)

Rentang peluang antrian ditentukan dari grafik dan persamaan pada **Gambar 5.7**

Gambar 5.7 Rentang Peluang Antrian Terhadap Derajat Kejenuhan

$$\begin{aligned} QP \% &= 9,02 \times DS + 20,66 \times DS^2 + 10,49 \times DS^3 \\ &= 9,02 \times 1,08 + 20,66 \times (1,08)^2 + 10,49 \times (1,08)^3 \\ &= 47 \% \end{aligned}$$

$$\begin{aligned} QP \% &= 47,71 \times DS + 24,68 \times DS^2 + 56,47 \times DS^3 \\ &= 47,71 \times 1,08 + 24,68 \times (1,08)^2 + 56,47 \times (1,08)^3 \\ &= 95 \% \end{aligned}$$

Jadi peluang antrian = 47 % - 96 %

Berdasarkan analisa diatas dapat disimpulkan bahwa kondisi eksisting simpang tak bersinyal pada weekday puncak siang didapatkan nilai derajat kejenuhan (DS) sebesar 1,08

lebih dari 0,75 dan nilai peluang antrian yang terjadi antara 47 % - 96 % < 100 % mengindikasikan bahwa simpang tersebut kinerjanya sudah tidak memenuhi persyaratan yang diinginkan sebagaimana dalam MKJI 1997.

Tabel 5.6 Rekapitulasi Kinerja Simping Tak Bersinyal
Weekday Tahun 2017

| JAM PUNCAK | KAPASITAS (smp/jam) | DERAJAT KEJENUHAN | PELUANG ANTRIAN | TUNDAAN SIMPANG (det/smp) |
|---------------|------------------------|----------------------|--------------------|---------------------------------|
| | C | DS | QP % | D |
| PAGI | 5364 | 1,42 | 84 - 179 | -64,96 |
| SIANG | 4806 | 1,08 | 47 - 95 | 22,70 |
| SORE | 5238 | 0,98 | 38 - 76 | 18,07 |

Sumber : Hasil Perhitungan

Tabel 5.7 Rekapitulasi Kinerja Simping Tak Bersinyal
Weekend Tahun 2017

| JAM PUNCAK | KAPASITAS (smp/jam) | DERAJAT KEJENUHAN | PELUANG ANTRIAN | TUNDAAN SIMPANG (det/smp) |
|---------------|------------------------|----------------------|--------------------|---------------------------------|
| | C | DS | QP % | D |
| PAGI | 5138 | 1,22 | 61 - 123 | 46,50 |
| SIANG | 4996 | 1,09 | 48 - 96 | 24,69 |
| SORE | 5046 | 0,85 | 29 - 58 | 14,34 |

Sumber : Hasil Perhitungan

Berdasarkan hasil analisa kinerja simping tak bersinyal tahun 2017 pada Puncak Pagi, Puncak Siang, dan Puncak Sore diatas didapatkan nilai $DS > 0,75$ dan nilai QP berkisar $|29 \% - 179 \%| > 100 \%$, sehingga simpang tersebut tidak sesuai persyaratan MKJI 1997. Maka perlu adanya perbaikan simpang berupa Simping Bersinyal pada tahun 2017.

BAB VI

ALTERNATIF PERBAIKAN KINERJA SIMPANG

6.1 Analisa Perbaikan Alternatif 1 (Pelebaran Jalan, Simpang Bersinyal, dan Hambatan Samping)

Dari hasil perhitungan simpang tak bersinyal pada BAB V, analisa kinerja simpang Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul didapatkan rata-rata $DS > 0,75$. Dengan mengacu pada kondisi tersebut maka perlu didakan perbaikan kinerja pada simpang.

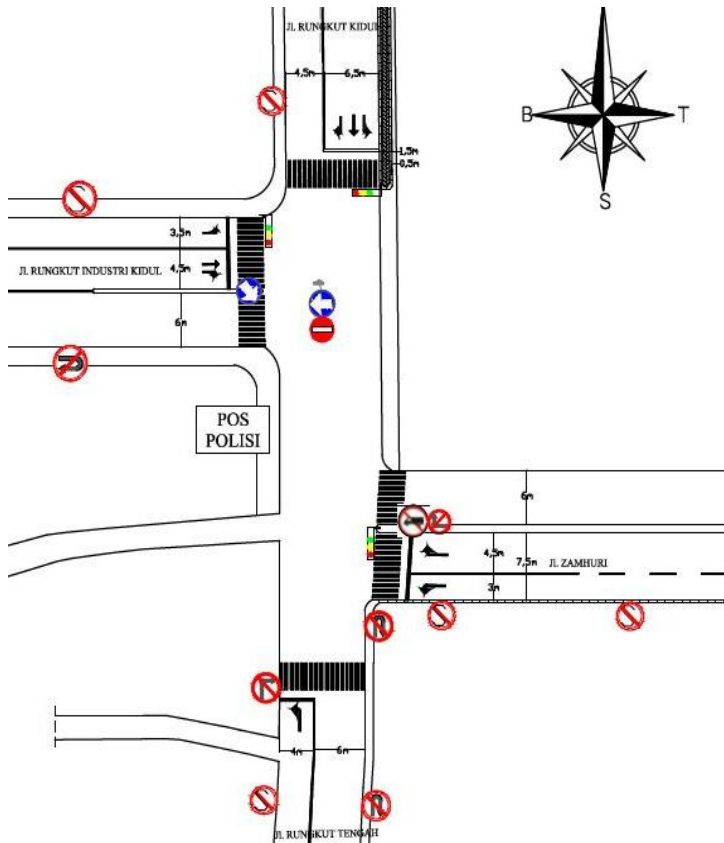

Alternative perbaikan yang digunakan untuk memperbaiki kinerja persimpangan adalah pelebaran jalan pada W_{MASUK} , mengubah manajemen lalu lintas menjadi simpang bersinyal, serta mengurangi hambatan samping menjadi kategori sedang dengan cara memasang trotoar dan menambah rambu dilarang berhenti ± 100 m dari simpang. Berikut analisa alternative yang akan digunakan untuk perbaikan :

6.1.1 Kondisi Geometrik Persimpangan

Lebar pendekat pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul dapat diuraikan sebagai berikut :

- a. Pendekat Utara Jl. Rungkut Kidul
 - Lebar Pendekat : 11 m
 - Lebar Masuk : 6,5 m
 - Lebar Keluar : 6 m
- b. Pendekat Selatan Jl. Rungkut Tengah
 - Lebar Pendekat : 10 m
 - Lebar LTOR : 4 m
 - Lebar Keluar : 6 m

- c. Pendekat Timur Jl. Zamhuri
 - Lebar Pendekat : 7,5 m
 - Lebar Masuk : 7,5 m
 - Lebar Keluar : 6 m
- d. Pendekat Barat Jl. Rungkut Industri Kidul
 - Lebar Pendekat : 8 m
 - Lebar Masuk : 4,5 m
 - Lebar LTOR : 3,5 m
 - Lebar Keluar : 6 m

Gambar 6.1 Kondisi Geometrik Simpang Bersinyal Alternatif 1

6.1.2 Hambatan Samping

Pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul terdapat hambatan samping pada setiap pendekat, yaitu :

- Pendekat Utara Jl. Rungkut Kidul : Sedang
- Pendekat Selatan Jl. Rungkut Tengah : Sedang
- Pendekat Timur Jl. Zamhuri : Sedang
- Pendekat Barat Jl. Rungkut Industri Kidul : Sedang

6.1.3 Pengaturan Fase pada Persimpangan

1. Fase 1

- Lampu hijau menyala pada pendekat utara Jl. Rungkut Kidul. Arus ST, RT, dan LT bergerak.
- Lampu merah menyala pada pendekat timur Jl. Zamhuri. Arus ST dan LT berhenti.
- Lampu merah menyala pada pendekat barat Jl. Rungkut Industri Kidul. Arus ST dan RT berhenti, LTOR jalan terus.
- LTOR pendekat selatan Jl. Rungkut Tengah jalan terus.

2. Fase 2

- Lampu merah menyala pada pendekatan utara Jl. Rungkut Kidul. Arus ST, RT, dan LT berhenti.
- Lampu merah menyala pada pendekatan timur Jl. Zamhuri. Arus ST dan LT berhenti.
- Lampu hijau menyala pada pendekatan barat Jl. Rungkut Industri Kidul. Arus ST dan RT bergerak, LTOR jalan terus.
- LTOR pendekatan selatan Jl. Rungkut Tengah jalan terus.

3. Fase 3

- Lampu merah menyala pada pendekatan utara Jl. Rungkut Kidul. Arus ST, RT, dan LT berhenti.
- Lampu hijau menyala pada pendekatan timur Jl. Zamhuri. Arus ST dan LT bergerak.

- Lampu merah menyala pada pendekat barat Jl. Rungkut Industri Kidul. Arus ST dan RT berhenti, LTOR jalan terus.
- LTOR pendekat selatan Jl. Rungkut Tengah jalan terus

6.1.4 Perhitungan Simpang Bersinyal Weekday Puncak Siang

6.1.4.1 Belok Kiri Langsung

Pada pendekat selatan Jl. Rungkut Tengah terdapat belok kiri langsung (LTOR) menuju Jl. Rungkut Industri Kidul dan pada pendekat barat Jl. Rungkut Industri Kidul terdapat belok kiri langsung (LTOR) menuju Jl. Rungkut Kidul.

6.1.4.2 Data Volume Lalu Lintas

Volume Kendaraan Weekday Puncak Siang

a. Kendaraan Ringan (LV)

| PENDEKAT | ARAH | LV | | |
|-----------------------------------|-------|--------------------|------------|----------|
| | | emp terlindung = 1 | | |
| | | emp terlawan = 1 | | |

6.1.4.3 Rasio Kendaraan Berbelok dan Rasio UM/MV

1. Pendekat Utara Jl. Rungkut Kidul

- Rasio Kendaraan Belok Kiri (P_{LT})

$$P_{LT} \text{ (terlindung)} = \frac{LT \text{ (smp/jam)}}{Q \text{ total (smp/jam)}}$$

$$= \frac{64}{1030} = 0,06$$
- Rasio Kendaraan Belok Kanan (P_{RT})

$$P_{RT} \text{ (terlindung)} = \frac{RT \text{ (smp/jam)}}{Q \text{ total (smp/jam)}}$$

$$= \frac{492}{1030} = 0,43$$
- Rasio Kendaraan Tak Bermotor (P_{UM})

$$P_{UM} = \frac{Q \text{ UM (kend/jam)}}{Q \text{ MV (kend/jam)}}$$

$$= \frac{55}{2440} = 0,023$$

2. Pendekat Selatan Jl. Rungkut Tengah

- Rasio Kendaraan Belok Kiri ($P_{L\text{TOR}}$)

$$P_{L\text{TOR}} (\text{terlindung}) = \frac{L\text{TOR (smp/jam)}}{Q \text{ total (smp/jam)}}$$

$$= \frac{813}{813} = 1$$
- Rasio Kendaraan Tak Bermotor (P_{UM})

$$P_{\text{UM}} = \frac{Q \text{ UM (kend/jam)}}{Q \text{ MV (kend/jam)}}$$

$$= \frac{16}{2180} = 0,007$$

3. Pendekat Timur Jl. Zamhuri

- Rasio Kendaraan Belok Kiri ($P_{L\text{T}}$)

$$P_{L\text{T}} (\text{terlindung}) = \frac{L\text{T (smp/jam)}}{Q \text{ total (smp/jam)}}$$

$$= \frac{86}{147} = 0,59$$
- Rasio Kendaraan Tak Bermotor (P_{UM})

$$P_{\text{UM}} = \frac{Q \text{ UM (kend/jam)}}{Q \text{ MV (kend/jam)}}$$

$$= \frac{19}{625} = 0,03$$

4. Pendekat Barat Jl. Rungkut Industri Kidul

- Rasio Kendaraan Belok Kiri ($P_{L\text{TOR}}$)

$$P_{L\text{TOR}} (\text{terlindung}) = \frac{L\text{TOR (smp/jam)}}{Q \text{ total (smp/jam)}}$$

$$= \frac{484}{1290} = 0,37$$

- Rasio Kendaraan Belok Kanan (P_{RT})

$$P_{RT} \text{ (terlindung)} = \frac{RT \text{ (smp/jam)}}{Q \text{ total (smp/jam)}}$$

$$= \frac{273}{1290} = 0,22$$
- Rasio Kendaraan Tak Bermotor (P_{UM})

$$P_{UM} = \frac{Q \text{ UM (kend/jam)}}{Q \text{ MV (kend/jam)}}$$

$$= \frac{54}{3108} = 0,017$$

6.1.4.4 Penentuan Waktu Hilang Total (LTI) dan Waktu Merah Semua (*All Red*)

1. Jarak datang dan jarak berangkat

- Fase 1 (Pendekat Utara) – Fase 2 (Pendekat Barat)

Jarak berangkat (L_{EV}) = 17,1 m
 Jarak datang (L_{AV}) = 12,4 m

- Fase 2 (Pendekat Barat) – Fase 3 (Pendekat Timur)

Jarak berangkat (L_{EV}) = 40,1 m
 Jarak datang (L_{AV}) = 6,93 m

- Fase 3 (Pendekat Timur) – Fase 1 (Pendekat Utara)

Jarak berangkat (L_{EV}) = 7,5 m
 Jarak datang (L_{AV}) = 45,1 m

2. Perhitungan Waktu Merah Semua (*All Red*)

- Fase 1 – Fase 2

$$\begin{aligned}\text{Merah Semua} &= \frac{(L_{EV} + I_{EV})}{V_{EV}} - \frac{L_{AV}}{V_{AV}} \\ &= \frac{(17,1 + 5)}{10} - \frac{12,4}{10} \\ &= 0,97 \sim 2 \text{ detik}\end{aligned}$$

Jadi, pada Fase 1 – Fase 2

Waktu Kuning (*amber*) = 3 detik

Merah semua (*all red*) = 2 detik

- Fase 2 – Fase 3

$$\begin{aligned}\text{Merah Semua} &= \frac{(L_{EV} + I_{EV})}{V_{EV}} - \frac{L_{AV}}{V_{AV}} \\ &= \frac{(40,1 + 5)}{10} - \frac{6,93}{10} \\ &= 3,8 \sim 4 \text{ detik}\end{aligned}$$

Jadi, pada Fase 2 – Fase 3

Waktu Kuning (*amber*) = 3 detik

Merah semua (*all red*) = 4 detik

- Fase 3 – Fase 1

$$\begin{aligned}\text{Merah Semua} &= \frac{(L_{EV} + I_{EV})}{V_{EV}} - \frac{L_{AV}}{V_{AV}} \\ &= \frac{(7,5 + 5)}{10} - \frac{45,1}{10} \\ &= -3,2 \sim 0 \text{ detik}\end{aligned}$$

Jadi, pada Fase 3 – Fase 1

Waktu Kuning (*amber*) = 2 detik

Merah semua (*all red*) = 0 detik

Maka hasil perhitungan Waktu Hilang Total (LTI)

$$LTI = \Sigma IG$$

$$= (2+3) + (4+3) + (0+2)$$

$$= 14 \text{ detik}$$

6.1.4.5 Penentuan Tipe Pendekat

Tipe pendekat pada simpang bersinyal dibagi menjadi dua, yaitu terlindung (P) dan terlawan (O). Pada kondisi eksisting persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul tipe pendekat keseluruhan termasuk dalam tipe terlindung (P).

6.1.4.6 Penentuan Lebar Pendekat Efektif

Lebar pendekat efektif merupakan lebar jalan yang digunakan kendaraan untuk antri selama waktu merah dengan ketentuan sebagai berikut ;

- **Prosedur untuk pendekat tanpa belok kiri langsung (LTOR)**

Hanya untuk pendekat tipe P, jika $W_{KELUAR} < W_e \times (1 - P_{RT} - P_{LTOR})$, sebaiknya diberi nilai baru yang sama dengan W_{KELUAR} dan analisa penentuan waktu sinyal untuk pendekat ini dilakukan hanya untuk bagian lalu-lintas lurus saja ($Q = Q_{ST}$).

- **Prosedur untuk Pendekat dengan Belok Kiri Langsung (LTOR)**

Jika $W_{LTOR} \geq 2m$

Langkah 1

$$W_e = \text{Min} \begin{cases} W_A - W_{LTOR} \\ W_{MASUK} \end{cases}$$

Maka $Q = Q_{ST} + Q_{RT}$

1. Pendekat Utara (Jl. Rungkut Kidul)

Pendekat utara merupakan pendekat tipe P tanpa LTOR, dimana ketentuan untuk $W_{Efektif}$ sebagai berikut :

$$\begin{aligned} W_{KELUAR} &< W_e \times (1 - P_{RT} - P_{LT}) \\ 6 \text{ m} &> 6,5 \times (1 - 0,48 - 0,03) \\ 6 \text{ m} &> 3,185 \text{ m} \end{aligned}$$

Maka, $W_{Efektif}$ sama dengan $W_{Masuk} = 6,5 \text{ m}$

$$Q = Q_{ST} + Q_{LT} + Q_{RT} = 1030 \text{ smp/jam}$$

2. Pendekat Selatan (Jl. Rungkut Tengah)

Pendekat selatan merupakan pendekat tipe P dan pergerakan hanya LTOR dengan $W_{LTOR} > 2$ m, dimana ketentuan untuk $W_{Efektif}$ sebagai berikut :

$$\begin{aligned}
 W_e = \text{Min} & \left\{ \begin{array}{l} W_A - W_{LTOR} \\ W_{MASUK} \end{array} \right. \\
 W_e = \text{Min} & \left\{ \begin{array}{l} 4 \text{ m} - 4 \text{ m} = 0 \text{ m} \\ 0 \text{ m} \end{array} \right.
 \end{aligned}$$

Maka, $W_{Efektif}$ sama dengan $W_{Masuk} = 0$ m
 $Q = Q_{ST} + Q_{RT} = 0$ smp/jam

3. Pendekat Timur (Jl. Zamhuri)

Pendekat timur merupakan pendekat tipe P tanpa LTOR, dimana ketentuan untuk $W_{Efektif}$ sebagai berikut :

$$\begin{aligned}
 W_{KELUAR} & < & W_e \times (1 - P_{RT} - P_{LT}) \\
 6 \text{ m} & > & 7,5 \times (1 - 1 - 0,59) \\
 6 \text{ m} & > & -4,425 \text{ m}
 \end{aligned}$$

Maka, $W_{Efektif}$ sama dengan $W_{Masuk} = 7,5$ m
 $Q = Q_{ST} + Q_{LT} = 147$ smp/jam

4. Pendekat Barat (Jl. Rungkut Industri Kidul)

Pendekat barat merupakan pendekat tipe P dan pergerakan hanya LTOR dengan $W_{LTOR} > 2$ m, dimana ketentuan untuk $W_{Efektif}$ sebagai berikut :

$$W_e = \text{Min} \left\{ \begin{array}{l} W_A - W_{LTOR} \\ W_{MASUK} \end{array} \right.$$

$$W_e = \text{Min} \left\{ \begin{array}{l} 8 \text{ m} - 3,5 \text{ m} = 4,5 \text{ m} \\ 4,5 \text{ m} \end{array} \right.$$

Maka, W_{Efektif} sama dengan $W_{\text{Masuk}} = 4,5 \text{ m}$

$$Q = Q_{\text{ST}} + Q_{\text{RT}} = 806 \text{ smp/jam}$$

6.1.4.7 Arus Jenuh Dasar

Perhitungan arus jenuh dasar pada puncak Pagi, Siang, dan Sore dapat diurikan sebagai berikut :

1. Pendekat Utara (Jl. Rungkut Kidul)

$$\begin{aligned} S_o &= 600 \times 6,5 \\ &= 3900 \text{ smp/jam hijau} \end{aligned}$$

2. Pendekat Selatan (Jl. Rungkut Tengah)

$$\begin{aligned} S_o &= 600 \times 0 \\ &= 0 \text{ smp/jam hijau} \end{aligned}$$

3. Pendekat Timur (Jl. Zamhuri)

$$\begin{aligned} S_o &= 600 \times 7,5 \\ &= 4500 \text{ smp/jam hijau} \end{aligned}$$

4. Pendekat Barat (Jl. Rungkut Industri Kidul)

$$\begin{aligned} S_o &= 600 \times 4,5 \\ &= 2700 \text{ smp/jam hijau} \end{aligned}$$

6.1.4.8 Faktor Penyesuaian Ukuran Kota (F_{CS})

Berdasarkan jumlah penduduk kota Surabaya pada **Tabel 4.9** Hasil Perhitungan Regresi Pertumbuhan Penduduk Kota Surabaya, menunjukkan jumlah penduduk kota Surabaya Tahun 2017 sebesar 3.029.578 jiwa. Kemudian dari jumlah tersebut dicari nilai koefisiennya pada **Tabel 6.1** dan di dapat $F_{CS} = 1,05$.

Tabel 6.1 Faktor Penyesuaian Ukuran Kota

| Ukuran kota | Penduduk (juta) | Faktor penyesuaian ukuran kota (F_{CS}) |
|--------------|-----------------|---|
| Sangat kecil | <0,1 | 0.82 |
| Kecil | 0,1-0,5 | 0.88 |
| Sedang | 0,5-1,0 | 0.94 |
| Besar | 1.0-3.0 | 1 |
| Sangat besar | >3,0 | 1.05 |

Sumber : MKJI 1997

6.1.4.9 Faktor Penyesuaian Hambatan Samping (F_{SF})

Faktor Penyesuaian Tipe Lingkungan Jalan, Hambatan Samping, dan Kendaraan Tak Bermotor (F_{SF}) dihitung dengan menggunakan **Tabel 6.2** Faktor Penyesuaian Tipe Lingkungan Jalan, Hambatan Samping, dan Kendaraan Tak Bermotor (F_{SF}). Variable masukan adalah tipe jalan (RE), kelas hambatan samping, dan rasio kendaraan tak bermotor (P_{UM}).

Tabel 6.2 Faktor Penyesuaian Tipe Lingkungan Jalan, Hambatan Samping, dan Kendaraan Tak Bermotor (F_{SF})

| Lingkungan Jalan | Hambatan Samping | Tipe fase | Rasio kendaraan tak bermotor | | | | | |
|------------------|------------------|-----------|------------------------------|------|------|------|------|------|
| | | | 0 | 0.05 | 0.1 | 0.15 | 0.2 | 0.25 |
| COM | Tinggi | O | 0.93 | 0.88 | 0.84 | 0.79 | 0.74 | 0.7 |
| | | P | 0.93 | 0.91 | 0.88 | 0.87 | 0.85 | 0.81 |
| | Sedang | O | 0.94 | 0.89 | 0.85 | 0.8 | 0.75 | 0.71 |
| | | P | 0.94 | 0.92 | 0.89 | 0.88 | 0.86 | 0.82 |
| | Rendah | O | 0.95 | 0.9 | 0.86 | 0.81 | 0.76 | 0.72 |
| | | P | 0.95 | 0.93 | 0.9 | 0.89 | 0.87 | 0.83 |
| RES | Tinggi | O | 0.96 | 0.91 | 0.86 | 0.81 | 0.78 | 0.72 |
| | | P | 0.96 | 0.94 | 0.92 | 0.89 | 0.86 | 0.84 |
| | Sedang | O | 0.97 | 0.92 | 0.87 | 0.82 | 0.79 | 0.73 |
| | | P | 0.97 | 0.95 | 0.93 | 0.9 | 0.87 | 0.85 |
| | Rendah | O | 0.98 | 0.93 | 0.88 | 0.83 | 0.8 | 0.74 |
| | | P | 0.98 | 0.96 | 0.94 | 0.91 | 0.88 | 0.86 |
| RA | | O | 1 | 0.95 | 0.9 | 0.85 | 0.8 | 0.75 |
| | | P | 1 | 0.98 | 0.95 | 0.93 | 0.9 | 0.88 |

Sumber : MKJI 1997

Perhitungan dilakukan dengan cara interpolasi nilai P_{UM} .
Untuk perhitungan akan diuraikan sebagai berikut :

1. Pendekat Utara (Jl. Rungkut Kidul)

Tipe Lingkungan = COM, Hambatan Samping =
Tinggi, Tipe fase terlindung (P), $P_{UM} = 0,023$

| RASIO | F_{SF} |
|-------|----------|
| 0.00 | 0.94 |
| 0.023 | X |
| 0.05 | 0.92 |

$$X = 0,92 - \{(0,05 - 0,023 / 0,05 - 0,00) \times (0,92 - 0,94)\} \\ = 0,931$$

Jadi, nilai F_{SF} adalah 0,931.

2. Pendekat Selatan (Jl. Rungkut Tengah)

Tipe Lingkungan = COM, Hambatan Samping =
Tinggi, Tipe fase terlindung (P), $P_{UM} = 0,007$

| RASIO | F_{SF} |
|-------|----------|
| 0.00 | 0.94 |
| 0.007 | X |
| 0.05 | 0.92 |

$$X = 0,92 - \{(0,05 - 0,007 / 0,05 - 0,00) \times (0,92 - 0,94)\} \\ = 0,937$$

Jadi, nilai F_{SF} adalah 0,937.

3. Pendekat Timur (Jl. Zamhuri)

Tipe Lingkungan = COM, Hambatan Samping =
Sedang, Tipe fase terlindung (P), $P_{UM} = 0,03$

| RASIO | F_{SF} |
|-------|----------|
| 0.00 | 0.94 |
| 0.03 | X |
| 0.05 | 0.92 |

$$X = 0,92 - \{(0,05 - 0,03 / 0,05 - 0,00) \times (0,92 - 0,94)\} \\ = 0,928$$

Jadi, nilai F_{SF} adalah 0,928.

4. Pendekat Barat (Jl. Rungkut Industri Kidul)

Tipe Lingkungan = COM, Hambatan Samping =
Tinggi, Tipe fase terlindung (P), $P_{UM} = 0,017$

| RASIO | F_{SF} |
|-------|----------|
| 0.00 | 0.94 |
| 0.017 | X |
| 0.05 | 0.92 |

$$X = 0,92 - \{(0,05 - 0,017 / 0,05 - 0,00) \times (0,92 - 0,94)\} \\ = 0,933$$

Jadi, nilai F_{SF} adalah 0,933.

6.1.4.10 Faktor Penyesuaian Kelandaian (F_G)

Faktor Penyesuaian Kelandaian (F_G) ditentukan dari gradient yang merupakan fungsi kelandaian pada setiap pendekat. Pada persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul kelandaian yang ada pada setiap pendekat adalah 0%, sehingga didapatkan factor penyesuaian kelandaian sebesar 1,00.

6.1.4.11 Faktor Penyesuaian Belok Kanan

Factor penyesuaian belok kanan (F_{RT}) hanya digunakan untuk tipe pendekat terlindung, tanpa median, dan jalan 2 arah. Perhitungan menggunakan rumus 2.26 sebagai berikut :

1. Pendekat Utara

$$\begin{aligned} F_{RT} &= 1 \times P_{RT} \times 0,26 \\ &= 1 \times 0,48 \times 0,26 \\ &= 1,12 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned} F_{RT} &= 1 \times P_{RT} \times 0,26 \\ &= 1 \times 0,00 \times 0,26 \\ &= 1,00 \end{aligned}$$

3. Pendekat Timur (terdapat median)

$$\begin{aligned} F_{RT} &= 1 \times P_{RT} \times 0,26 \\ &= 1 \times 0,00 \times 0,26 \\ &= 1,00 \end{aligned}$$

4. Pendekat Barat (terdapat median)

$$\begin{aligned} F_{RT} &= 1 \times P_{RT} \times 0,26 \\ &= 1 \times 0,00 \times 0,26 \\ &= 1,00 \end{aligned}$$

6.1.4.12 Factor Penyesuaian belok kiri (F_{LT})

Factor penyesuaian belok kiri (F_{LT}) digunakan untuk tipe pendekat terlindung tanpa LTOR. Perhitungan menggunakan rumus dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$\begin{aligned} F_{LT} &= 1 - P_{LT} \times 0,16 \\ &= 1 - 0,06 \times 0,16 \\ &= 0,99 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned} F_{LT} &= 1 - P_{LT} \times 0,16 \\ &= 1 - 0,00 \times 0,16 \\ &= 1,00 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 F_{LT} &= 1 - P_{LT} \times 0,16 \\
 &= 1 - 0,59 \times 0,16 \\
 &= 0,91
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 F_{LT} &= 1 - P_{LT} \times 0,16 \\
 &= 1 - 0,00 \times 0,16 \\
 &= 1,00
 \end{aligned}$$

6.1.4.13 Nilai Arus Jenuh yang Disesuaikan (S)

Perhitungan nilai arus jenuh dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$\begin{aligned}
 S &= S_o \times F_{CS} \times F_{SF} \times FG \times FP \times F_{RT} \times F_{LT} \\
 &= 3900 \times 1,05 \times 0,931 \times 1,00 \times 1,00 \times 1,12 \times 0,99 \\
 &= 4243 \text{ smp/jam hijau}
 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned}
 S &= S_o \times F_{CS} \times F_{SF} \times FG \times FP \times F_{RT} \times F_{LT} \\
 &= 0 \times 1,05 \times 0,937 \times 1,00 \times 1,00 \times 1,00 \times 1,00 \\
 &= 0 \text{ smp/jam hijau}
 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 S &= S_o \times F_{CS} \times F_{SF} \times FG \times FP \times F_{RT} \times F_{LT} \\
 &= 4500 \times 1,05 \times 0,928 \times 1,00 \times 1,00 \times 1,00 \times 0,91 \\
 &= 3971 \text{ smp/jam hijau}
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 S &= S_o \times F_{CS} \times F_{SF} \times FG \times FP \times F_{RT} \times F_{LT} \\
 &= 2700 \times 1,05 \times 0,933 \times 1,00 \times 1,00 \times 1,00 \times 1,00 \\
 &= 2645 \text{ smp/jam hijau}
 \end{aligned}$$

6.1.4.14 Arus Lalu Lintas (Q)

Berdasarkan survey yang telah dilakukan, maka arus lalu lintas terlindung pada masing – masing pendekat adalah sebagai berikut :

1. Pendekat Utara $Q = 1030 \text{ smp/jam}$
2. Pendekat Selatan $Q = 0 \text{ smp/jam}$

- 3. Pendekat Timur $Q = 147 \text{ smp/jam}$
- 4. Pendekat Barat $Q = 807 \text{ smp/jam}$

6.1.4.15 Rasio Arus (FR)

Perhitungan nilai arus jenuh dapat diuraikan sebagai berikut :

- 1. Pendekat Utara

$$FR = Q / S$$

$$= 1030 / 4243 = 0,243$$
- 2. Pendekat Selatan

$$FR = Q / S$$

$$= 0 / 0 = 0$$
- 3. Pendekat Timur

$$FR = Q / S$$

$$= 147 / 3971 = 0,037$$
- 4. Pendekat Barat

$$FR = Q / S$$

$$= 807 / 2645 = 0,305$$

6.1.4.16 Rasio Arus Kritis (FR_{CRIT})

Rasio arus kritis diambil dari nilai rasio arus yang tertinggi dari setiap fasenya. Sehingga Rasio Arus Kritis (FR_{CRIT}) pada simpang = Rasio Arus (FR).

- 1. Pendekat Utara $FR_{CRIT} = 0,243$
- 2. Pendekat Selatan $FR_{CRIT} = 0$
- 3. Pendekat Timur $FR_{CRIT} = 0,037$
- 4. Pendekat Barat $FR_{CRIT} = 0,305$

6.1.4.17 Rasio Arus Simpang (IFR)

Rasio Arus Simpang (IFR) diambil dari jumlah nilai rasio arus kritis (FR_{CRIT}).

$$IFR \text{ total} = 0,243 + 0 + 0,037 + 0,305$$

$$= 0,585$$

6.1.4.18 Rasio Fase (PR)

Perhitungan nilai arus jenuh dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$\begin{aligned} PR &= FR_{CRIT} / IFR \text{ TOTAL} \\ &= 0,243 / 0,585 \\ &= 0,415 \end{aligned}$$
2. Pendekat Selatan

$$\begin{aligned} PR &= FR_{CRIT} / IFR \text{ TOTAL} \\ &= 0 / 0,585 \\ &= 0 \end{aligned}$$
3. Pendekat Timur

$$\begin{aligned} PR &= FR_{CRIT} / IFR \text{ TOTAL} \\ &= 0,037 / 0,585 \\ &= 0,063 \end{aligned}$$
4. Pendekat Barat

$$\begin{aligned} PR &= FR_{CRIT} / IFR \text{ TOTAL} \\ &= 0,305 / 0,585 \\ &= 0,522 \end{aligned}$$

6.1.4.19 Waktu Siklus dan Waktu Hijau

1. Waktu Siklus Sebelum Penyesuaian (Cua)

Menghitung waktu siklus sebelum penyesuaian (Cua) untuk pengendalian watu tetap berdasarkan perhitungan sebagai berikut :

$$\begin{aligned} Cua &= (1,5 \times LTI + 5) / (1 - IFR) \\ Cua &= (1,5 \times 14 + 5) / (1 - 0,585) \\ &= 63 \text{ detik} \end{aligned}$$

2. Waktu Hijau

Berikut ini waktu hijau berdasarkan perhitungan :

- a. Fase 1 (Pendekat Utara)

$$\begin{aligned} gi &= (Cua - LTI) \times PR \\ &= (63 - 14) \times 0,415 \\ &= 21 \text{ detik} \sim 92 \text{ detik} \end{aligned}$$

b. Fase 2 (Pendekat Barat)

$$\begin{aligned}
 g_i &= (Cua - LTI) \times PR \\
 &= (63 - 14) \times 0,522 \\
 &= 26 \text{ detik} \sim 115 \text{ detik}
 \end{aligned}$$

c. Fase 3 (Pendekat Timur)

$$\begin{aligned}
 g_i &= (Cua - LTI) \times PR \\
 &= (63 - 14) \times 0,063 \\
 &= 4 \text{ detik} \sim 14 \text{ detik}
 \end{aligned}$$

3. Waktu Siklus yang Disesuaikan (c)

Menghitung waktu siklus yang disesuaikan (c) berdasarkan dengan waktu hijau yang didibulatkan dijumlah dengan waktu hilang total (LTI).

$$\begin{aligned}
 c &= \Sigma g_i + LTI \\
 &= 221 + 14 \\
 &= 235
 \end{aligned}$$

Tabel 6.3 Waktu Siklus Perbaikan Puncak Siang

| FASE | 1 | 2 | 3 |
|----------|-------------------|----------------------------|-------------|
| PENDEKAT | JL. RUNGKUT KIDUL | JL. RUNGKUT INDUSTRI KIDUL | JL. ZAMHURI |
| detik | | | |
| HIAU | 92 | 115 | 14 |
| KUNING | 3 | 3 | 2 |
| ALLRED | 2 | 4 | 0 |
| CT | 235 | | |

6.1.4.20 Kapasitas (C)

Perhitungan nilai arus jenuh dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$\begin{aligned}
 C &= S \times g / c \\
 &= 4243 \times 92 / 235 \\
 &= 1661
 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned}
 C &= S \times g / c \\
 &= 0 \times 0 / 235 \\
 &= 0
 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 C &= S \times g / c \\
 &= 3971 \times 14 / 235 \\
 &= 237
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 C &= S \times g / c \\
 &= 26454 \times 115 / 235 \\
 &= 1294
 \end{aligned}$$

6.1.4.21 Derajat Kejenuhan (DS)

Derajat kejenuhan adalah suatu keadaan dimana simpang mengalami batas kejenuhan tertentu akibat pergerakan arus yang dibagi dengan kapasitas jalan yang ada. Perhitungan derajat kejenuhan dapat diuraikan sebagai berikut:

1. Pendekat Utara

$$\begin{aligned}
 DS &= Q / C \\
 &= 1030 / 1661 \\
 &= 0,620
 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned}
 DS &= Q / C \\
 &= 0 / 0 \\
 &= 0
 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 DS &= Q / C \\
 &= 147 / 237 \\
 &= 0,620
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 DS &= Q / C \\
 &= 807 / 1294 \\
 &= 0,623
 \end{aligned}$$

6.1.4.22 Rasio Arus Hijau (GR)

Perhitungan rasio arus hijau dapat diuraikan sebagai berikut:

1. Pendekat Utara

$$\begin{aligned} GR &= g / c \\ &= 92 / 235 \\ &= 0,391 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned} GR &= g / c \\ &= 0 / 235 \\ &= 0 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned} GR &= g / c \\ &= 14 / 235 \\ &= 0,060 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned} GR &= g / c \\ &= 115 / 235 \\ &= 0,489 \end{aligned}$$

6.1.4.23 Jumlah Kendaraan Antri (NQ)

Perhitungan jumlah kendaraan antri (NQ) menggunakan rumus **2.20**, **2.21**, dan **2.22** :

Untuk $DS > 0,5$, perhitungan NQ_1 adalah :

$$NQ_1 = 0,25 \times Cx \left((DS - 1) + \sqrt{(DS - 1)^2 + \frac{8x(DS - 0,5)}{C}} \right) \dots (2.20)$$

Untuk $DS \leq 0,5$: $NQ_1 = 0$

$$NQ_2 = cx \frac{1 - GR}{1 - GR \times DS} \times \frac{Q}{3600} \dots (2.21)$$

$$NQ = NQ_1 + NQ_2 \dots (2.22)$$

Berikut jumlah kendaraan antri (NQ) untuk masing-masing pendekat dapat diuraikan sebagai berikut:

1. Pendekat Utara

DS 0,620 > 0,5, maka

$$NQ1 = 0,25 \times 1661 \times \left((0,620 - 1) + \sqrt{(0,620 - 1)^2 + \frac{8 \times (0,620 - 0,5)}{1661}} \right)$$

$$NQ1 = 0,31$$

Gambar 6.2 Jumlah Kendaraan Antri (smp) yang Tersisa dari Fase Hijau Sederana (NQ_1)

$$\begin{aligned} NQ2 &= 235 \times \frac{1 - 0,391}{1 - 0,391 \times 0,620} \times \frac{1030}{3600} \\ &= 54 \end{aligned}$$

$$\begin{aligned} NQ &= NQ1 + NQ2 \\ &= 0,31 + 54 \\ &= 54,31 \end{aligned}$$

Menentukan NQMAX
PELUANG UNTUK PEMBEBANAN LEBIH POL

Gambar 6.3 Perhitungan Jumlah Antrian (NQ_{MAX}) Dalam smp

Dengan nilai $P_{OL} = 5\%$
 $NQ = 54,32$
 Maka, $NQ_{MAX} = 69$

2. Pendekat Selatan
 $DS < 0,5$, maka
 $NQ1 = 0$

$$\begin{aligned} NQ2 &= 235 \times \frac{1-0}{1-0 \times 0} \times \frac{0}{3600} \\ &= 0 \\ NQ &= NQ1 + NQ2 \\ &= 0 + 0 \\ &= 0 \end{aligned}$$

3. Pendekat Timur
 $DS > 0,5$, maka

$$\begin{aligned} NQ1 &= 0,25 \times 237 \times \left((0,620 - 1) + \sqrt{(0,620 - 1)^2 + \frac{8 \times (0,620 - 0,5)}{237}} \right) \\ NQ1 &= 0,31 \end{aligned}$$

Gambar 6.2 Jumlah Kendaraan Antri (smp) yang Tersisa dari Fase Hijau Sederana (NQ_1)

$$\begin{aligned}
 NQ_2 &= 235 \times \frac{1-0,060}{1-0,060 \times 0,46} \times \frac{147}{3600} \\
 &= 9,34 \\
 NQ &= NQ_1 + NQ_2 \\
 &= 0,31 + 9,34 \\
 &= 9,65
 \end{aligned}$$

Menentukan NQ_{MAX}
 PELUANG UNTUK PEMBEBANAN LEBIH POL

Gambar 6.3 Perhitungan Jumlah Antrian (NQ_{MAX}) Dalam smp

Dengan nilai $P_{OL} = 5\%$
 $NQ = 9,65$
 Maka, $NQ_{MAX} = 14$

4. Pendekat Barat
 $DS\ 0,623 > 0,5$, maka

$$NQ1 = 0,25 \times 1294 \times \left((0,623 - 1) + \sqrt{(0,623 - 1)^2 + \frac{8 \times (0,623 - 0,5)}{1294}} \right)$$

$$NQ1 = 0,33$$

Gambar 6.2 Jumlah Kendaraan Antri (smp) yang Tersisa dari Fase Hijau Sederana (NQ_1)

$$NQ2 = 235 \times \frac{1 - 0,489}{1 - 0,489 \times 0,623} \times \frac{807}{3600}$$

$$= 38,69$$

$$NQ = NQ1 + NQ2$$

$$= 0,33 + 38,69$$

$$= 38,69$$

Menentukan NQ_{MAX}

PELUANG UNTUK PEMBEBANAN LEBIH POL

Gambar 6.3 Perhitungan Jumlah Antrian (NQ_{MAX}) Dalam smp

Dengan nilai $P_{OL} = 5\%$
 $NQ = 38,69$
 Maka, $NQ_{MAX} = 54$

6.1.4.24 Panjang Antrian (QL)

Perhitungan panjang antrian masing-masing pendekat dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$QL = \frac{NQ_{MAX} \times 20}{W_{masuk}}$$

$$= \frac{76 \times 20}{6,5} = 234$$

2. Pendekat Selatan

$$\begin{aligned}
 QL &= \frac{NQ_{MAX} \times 20}{\frac{W_{masuk}}{0 \times 20}} \\
 &= \frac{0}{0} = 0
 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 QL &= \frac{NQ_{MAX} \times 20}{\frac{W_{masuk}}{14 \times 20}} \\
 &= \frac{14 \times 20}{7,5} = 37
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 QL &= \frac{NQ_{MAX} \times 20}{\frac{W_{masuk}}{54 \times 20}} \\
 &= \frac{54 \times 20}{4,5} = 240
 \end{aligned}$$

6.1.4.25 Rasio Kendaraan Terhenti (NS)

Perhitungan rasio kendaraan terhenti masing-masing pendekat dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$\begin{aligned}
 NS &= 0,9 \times \frac{NQ}{Q \times c} \times 3600 \\
 &= 0,9 \times \frac{54,32}{1030 \times 235} \times 3600 \\
 &= 0,727
 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned}
 NS &= 0,9 \times \frac{NQ}{Q \times c} \times 3600 \\
 &= 0,9 \times \frac{0}{0 \times 0} \times 3600 \\
 &= 0
 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 NS &= 0,9 \times \frac{NQ}{Q \times c} \times 3600 \\
 &= 0,9 \times \frac{9,66}{147 \times 235} \times 3600 \\
 &= 0,908
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 NS &= 0,9 \times \frac{NQ}{Q \times c} \times 3600 \\
 &= 0,9 \times \frac{39,02}{807 \times 235} \times 3600 \\
 &= 0,667
 \end{aligned}$$

6.1.4.26 Jumlah Kendaraan Terhenti (N_{SV})

Perhitungan jumlah kendaraan terhenti masing-masing pendekat dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$\begin{aligned}
 N_{SV} &= Q \times NS \\
 &= 1030 \times 0,727 \\
 &= 749
 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned}
 N_{SV} &= Q \times NS \\
 &= 0 \times 0 \\
 &= 0
 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 N_{SV} &= Q \times NS \\
 &= 147 \times 0,908 \\
 &= 133
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 N_{SV} &= Q \times NS \\
 &= 807 \times 0,667 \\
 &= 538
 \end{aligned}$$

6.1.4.27 Jumlah Kendaraan Terhenti Seluruh Simpang (NS_{TOTAL})

Perhitungan jumlah kendaraan seluruh simpang dapat diuraikan sebagai berikut :

$$\begin{aligned}
 NS_{TOT} &= \frac{\Sigma NSV}{Q_{total}} \\
 &= \frac{1420}{3279} = 0,43
 \end{aligned}$$

6.1.4.28 Tundaan Lalu Lintas Rata-Rata (DT)

Perhitungan tundaan lalu lintas rata-rata pada tiap pendekat dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$\begin{aligned}
 A &= \frac{0,5 \times (1-GR)^2}{(1-GR \times DS)} \\
 &= \frac{0,5 \times (1-0,391)^2}{(1-0,391 \times 0,620)} \\
 &= 0,24 \\
 DT &= c \times A + \frac{NQ1 \times 3600}{C} \\
 &= 235 \times 0,24 + \frac{0,31 \times 3600}{1661} \\
 &= 58,13
 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned}
 A &= \frac{0,5 \times (1-GR)^2}{(1-GR \times DS)} \\
 &= \frac{0,5 \times (1-0)^2}{(1-0 \times 0)} \\
 &= 0,5 \\
 DT &= c \times A + \frac{NQ1 \times 3600}{C} \\
 &= 235 \times 0,5 + \frac{0 \times 3600}{0} \\
 &= 0
 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 A &= \frac{0,5 \times (1-GR)^2}{(1-GR \times DS)} \\
 &= \frac{0,5 \times (1-0,06)^2}{(1-0,06 \times 0,620)} \\
 &= 0,46 \\
 DT &= c \times A + \frac{NQ1 \times 3600}{C} \\
 &= 235 \times 0,46 + \frac{0,31 \times 3600}{147} \\
 &= 112,66
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 A &= \frac{0,5 \times (1-GR)^2}{(1-GR \times DS)} \\
 &= \frac{0,5 \times (1-0,49)^2}{(1-0,49 \times 0,623)} \\
 &= 0,19
 \end{aligned}$$

$$\begin{aligned}
 DT &= c \times A + \frac{NQ1 \times 3600}{C} \\
 &= 235 \times 0,19 + \frac{0,33 \times 3600}{807} \\
 &= 44,99
 \end{aligned}$$

6.1.4.29 Tundaan Geometrik Rata-Rata (DGj)

Perhitungan tundaan geometrik rata-rata pada tiap pendekat dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$\begin{aligned}
 P_{SV} &= 1 + \frac{NQ - g}{C} \\
 &= 1 + \frac{54,3 - 92}{235} \\
 &= 0,84
 \end{aligned}$$

$$\begin{aligned}
 DGj &= (1 - PSV) \times PT \times 6 + (PSV \times 4) \\
 &= (1 - 0,84) \times 0,48 \times 6 + (0,84 \times 4) \\
 &= 4
 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned}
 P_{SV} &= 1 + \frac{NQ - g}{C} \\
 &= 1 + \frac{0 - 0}{235} \\
 &= 1,00
 \end{aligned}$$

$$\begin{aligned}
 DGj &= (1 - PSV) \times PT \times 6 + (PSV \times 4) \\
 &= (1 - 1,00) \times 0,99 \times 6 + (1,00 \times 4) \\
 &= 4
 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 P_{SV} &= 1 + \frac{NQ - g}{c} \\
 &= 1 + \frac{9,66 - 14}{235} \\
 &= 0,98
 \end{aligned}$$

$$\begin{aligned}
 DG_j &= (1 - PSV) \times PT \times 6 + (PSV \times 4) \\
 &= (1 - 0,98) \times 0,56 \times 6 + (0,98 \times 4) \\
 &= 3,99
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 P_{SV} &= 1 + \frac{NQ - g}{c} \\
 &= 1 + \frac{39,02 - 115}{235} \\
 &= 0,68
 \end{aligned}$$

$$\begin{aligned}
 DG_j &= (1 - PSV) \times PT \times 6 + (PSV \times 4) \\
 &= (1 - 0,68) \times 0,57 \times 6 + (0,68 \times 4) \\
 &= 4
 \end{aligned}$$

6.1.4.30 Tundaan Rata-Rata (D)

Perhitungan tundaan rata-rata pada tiap pendekat dapat diuraikan sebagai berikut :

1. Pendekat Utara

$$\begin{aligned}
 D &= DT + DG \\
 &= 58,13 + 3,82 \\
 &= 61,95
 \end{aligned}$$

2. Pendekat Selatan

$$\begin{aligned}
 D &= DT + DG \\
 &= 0 + 4 \\
 &= 4
 \end{aligned}$$

3. Pendekat Timur

$$\begin{aligned}
 D &= DT + DG \\
 &= 112,66 + 3,99 \\
 &= 116,65
 \end{aligned}$$

4. Pendekat Barat

$$\begin{aligned}
 D &= DT + DG \\
 &= 44,99 + 3,82 \\
 &= 48,81
 \end{aligned}$$

6.1.4.31 Tundaan Total

Perhitungan tundaan total pada tiap pendekat dapat diuraikan sebagai berikut :

1. Pendekat Utara
 $D \times Q = 61,95 \times 1030 = 63783$
2. Pendekat Selatan
 $D \times Q = 4 \times 0 = 0$
3. Pendekat Timur
 $D \times Q = 116,65 \times 147 = 17101$
4. Pendekat Barat
 $D \times Q = 48,81 \times 807 = 39375$

6.1.4.32 Tundaan Rata-Rata Seluruh Simpang

Perhitungan tundaan rata-ratas eluruh simpang dapat diuraikan sebagai berikut :

$$\begin{aligned}
 DI &= \frac{\Sigma(D \times Q)}{Q_{total}} \\
 &= \frac{120258}{3279} = 36,67 \text{ det/smp} \quad \longrightarrow \quad \text{LOS D}
 \end{aligned}$$

Dengan perhitungan seperti diatas, dapat diketahui rekapitulasi kinerja persimpangan setelah mengalami perbaikan alternative 1 adalah sebagai berikut :

Halaman ini sengaja dikosongkan

Tabel 6.4 Rekapitulasi Analisa Simpang Weekday Puncak Pagi Setelah Perbaikan Alternatif 1

Sumber : Hasil Perhitungan

Dari rekapitulasi diatas dapat diketahui bahwa setelah adanya perbaikan alternative 1 pada tahun 2017 – 2022 Weekend Puncak Sore, rata-rata DS kurang dari 0,75. Sedangkan kondisi Tundaan Simpang Rata-Rata (DI) terburuk yaitu 28,11 (LOS D).

6.2 Analisa Perbaikan Alternatif 2 (Perubahan Geometrik, Perubahan Fase, dan Penyesuaian Waktu Sinyal)

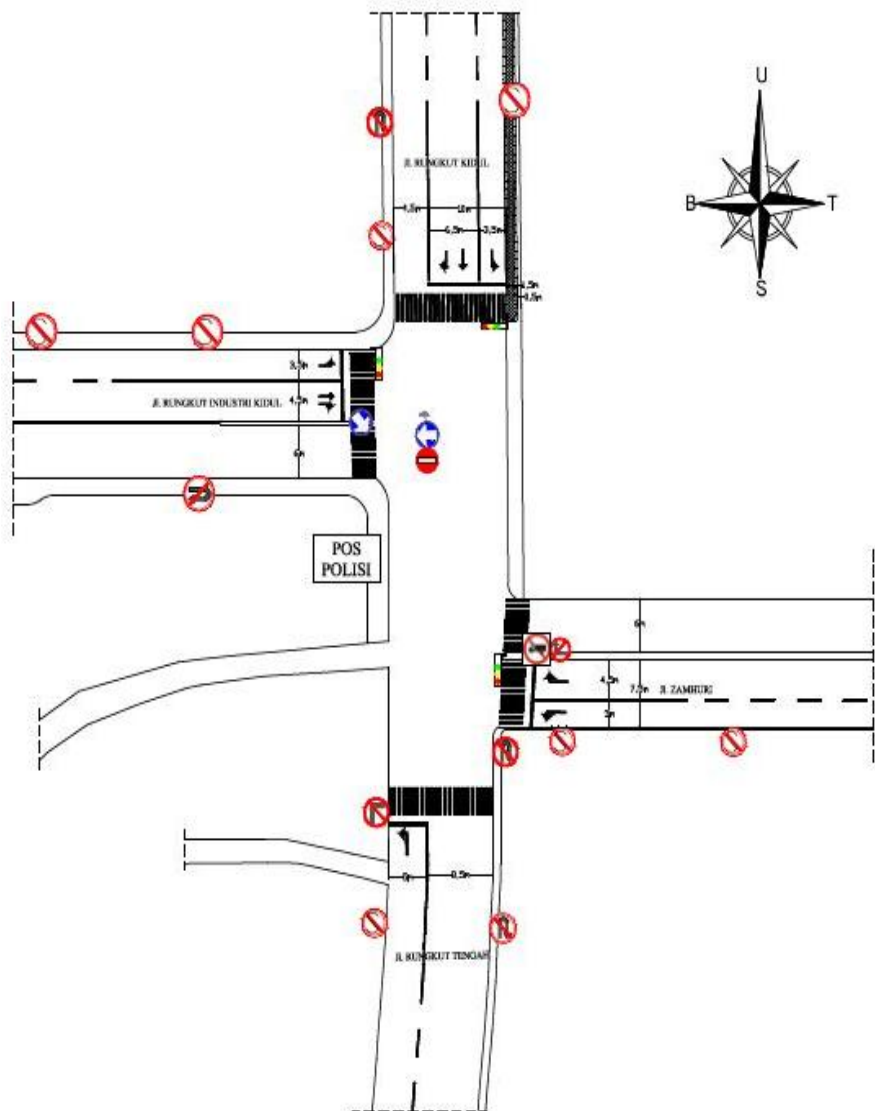

Alternative kedua yang digunakan untuk memperbaiki kinerja persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul yaitu dengan mengubah lebar geometric persimpangan, mengubah fase, serta mengatur ulang waktu sinyal yang disesuaikan untuk mengoptimalkan kinerja lalu lintas.

Untuk memudahkan proses perhitungan dan perbaikan simpang bersinyal, analisa secara manual berdasarkan panduan Manual Kapasitas Jalan Indonesia (MKJI) 1997 dengan proses yang sama seperti perhitungan pada alternative 1 serta menggunakan program KAJI.

Berikut analisa perbaikan alternative 2 yang akan digunakan untuk perbaikan :

6.2.1 Perubahan Geometrik Persimpangan

- Pada Pendekat Utara Jl. Rungkut Kidul direncanakan pelebaran W_{MASUK} sebesar 2 meter serta penambahan lajur untuk pergerakan LTOR sebesar 3,5 meter. Jadi lebar $W_{APPROACH}$ pada Jl. Rungkut Kidul yang semula 4,5 m menjadi 10 meter.
- Pada Pendekat Barat Jl. Rungkut Industri Kidul direncanakan pelebaran W_{MASUK} dengan mengurangi bahu jalan sebesar 1 m. Sehingga W_{MASUK} pada Jl. Rungkut Industri Kidul yang semula 3,5 m menjadi 4,5 m.
- Direncanakan pelebaran pada Pendekat Selatan Jl. Rungkut Tengah sebesar 5,5 meter. Jadi lebar W_{MASUK} pada Jl. Rungkut Tengah yang semula 4 meter menjadi 5 meter dan W_{KELUAR} yang semula 4 m menjadi 8,5 m.

Gambar 6.4 Kondisi Geometrik Simpang Bersinyal Alternatif 2

6.2.2 Perubahan Fase

1. Fase 1

- Lampu hijau menyala pada pendekat utara Jl. Rungkut Kidul. Arus ST, RT, dan LTOR bergerak.
- Lampu merah menyala pada pendekat timur Jl. Zamhuri. Arus ST dan LT berhenti.
- Lampu merah menyala pada pendekat barat Jl. Rungkut Industri Kidul. Arus ST dan RT berhenti, LTOR jalan terus.
- LTOR pendekat selatan Jl. Rungkut Tengah jalan terus.

2. Fase 2

- Lampu merah menyala pada pendekat utara Jl. Rungkut Kidul. Arus ST dan RT berhenti, LTOR jalan terus.
- Lampu hijau menyala pada pendekat timur Jl. Zamhuri. Arus ST dan LT bergerak.

- Lampu merah menyala pada pendekat barat Jl. Rungkut Industri Kidul. Arus ST dan RT berhenti, LTOR jalan terus.
- LTOR pendekat selatan Jl. Rungkut Tengah jalan terus.

3. Fase 3

- Lampu merah menyala pada pendekat utara Jl. Rungkut Kidul. Arus ST dan RT berhenti, LTOR jalan terus.
- Lampu merah menyala pada pendekat timur Jl. Zamhuri. Arus ST dan LT berhenti.
- Lampu hijau menyala pada pendekat barat Jl. Rungkut Industri Kidul. Arus ST dan RT bergerak, LTOR jalan terus.
- LTOR pendekat selatan Jl. Rungkut Tengah jalan terus.

6.2.3 Penyesuaian Waktu Sinyal

Pada persimpangan ini dilakukan pengaturan ulang waktu sinyal untuk mengoptimalkan kinerja lalu lintas pada persimpangan setelah dilakukan pelebaran geometric serta perubahan fase. Rekapitulasi waktu sinyal alternative 2 dapat dilihat pada Tabel Rekapitulasi Analisa Simpang Perbaikan Alternatif 2 berikut ini.

Tabel 6.10 Rekapitulasi Analisa Simpang Weekday Puncak Pagi Setelah Perbaikan Alternatif 2

Sumber : Hasil Perhitungan

Dari rekapitulasi diatas dapat diketahui bahwa setelah adanya perbaikan alternative 2 pada tahun 2017 – 2022 Weekend Puncak Sore, rata-rata DS kurang dari 0,75. Sedangkan kondisi Tundaan Simpang Rata-Rata (DI) terburuk yaitu 24,25 (LOS C).

BAB VII

KESIMPULAN DAN SARAN

7.1 Kesimpulan

1. Berdasarkan hasil analisa persimpangan Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul yang berupa simpang tak bersinyal pada *Weekday* dan *Weekend* tahun 2017 Puncak Pagi, Puncak Siang, dan Puncak Sore didapatkan $DS > 0,75$. Sedangkan Peluang antrian (QP) berkisar $|29 \% - 179 \%| > 100 \%$. Hal ini mengindikasikan bahwa simpang tersebut sudah tidak layak sesuai dengan persyaratan MKJI 1997. Oleh karena itu perlu adanya perbaikan kinerja persimpangan pada tahun 2017.
2. Perencanaan perbaikan alternative 1 yaitu dengan mengubah manajemen lalu lintas menjadi simpang bersinyal dengan pengaturan 3 fase, pelebaran jalan, serta mengurangi hambatan samping menjadi kategori sedang sejak tahun 2017. Berdasarkan hasil analisa perbaikan alternative 1 pada tahun 2017 dan prediksi 5 tahun yang akan datang (2018 - 2022) pada Puncak Pagi, Puncak Siang, dan Puncak Sore diperoleh rata-rata $DS < 0,75$ dengan Tundaan Simpang Rata-Rata (DI) berkisar $|26,58 - 39,07| \text{ det/smp}$ dan didapatkan rata-rata LOS D.
3. Perencanaan perbaikan alternative 2 sebagai alternative perbaikan terpilih yaitu dengan pelebaran jalan, perubahan fase, serta penyesuaian waktu sinyal. Berdasarkan hasil analisa perbaikan alternative 2 pada tahun 2017 dan prediksi 5 tahun yang akan datang (2018 - 2022) pada Puncak Pagi, Puncak Siang, dan Puncak Sore diperoleh rata-rata $DS < 0,75$ dengan Tundaan Simpang Rata-Rata (DI) berkisar $|22,28 - 35,79| \text{ det/smp}$ dan didapatkan rata-rata LOS C.

7.2 Saran

1. Pemerintah Kota Surabaya diharapkan membuka pengaturan Simpang Bersinyal 3 fase pada tahun 2017.
2. Pemerintah Kota Surabaya diharapkan melakukan perbaikan geometric untuk mengantisipasi kemacetan setiap tahun bertambah di lokasi simpang tersebut. Serta menambah trotoar dan memasang rambu dilarang berhenti pada sampai ± 100 m dari simpang supaya tingkat hambatan samping pada simpang menjadi kategori sedang.

DAFTAR ISTILAH

| Notasi | Istilah | Definisi |
|---------------|-------------------------------|--|
| | SIMPANG TAK BERSINYAL | |
| | LENGAN | Bagian persimpangan jalan dengan pendekat masuk atau keluar. |
| | JALAN UTAMA/JALAN MINOR | Jalan Utama adalah jalan yang paling penting pada persimpangan jalan, misalnya dalam hal klasifikasi jalan. Pada suatu simpang – 3 jalan yang menerus selalu ditentukan sebagai jalan utama. |
| | PENDEKAT | Tempat masuknya kendaraan dalam suatu lengan persimpangan jalan. Pendekat jalan utama disebut B dan D, jalan minor A dan C dalam arah jarum jam. |
| | TIPE MEDIAN JALAN UTAMA | Klasifikasi tipe median jalan utama, tergantung pada kemungkinan menggunakan median tersebut untuk menyeberangi jalan utama dalam dua tahap. |
| W_x | LEBAR PENDEKAT X (m) | Lebar dari bagian pendekat yang diperkeras, diukur di bagian tersempit, yang digunakan oleh lalu-lintas yang bergerak. X adalah nama |

pendekat. Apabila pendekat tersebut sering digunakan untuk parkir, lebar yang ada harus dikurangi 2 m.

| | | |
|--------------------------|--|--|
| W_I | LEBAR RATA-RATA SEMUA PENDEKAT X (m) | Lebar efektif rata-rata untuk <u>semua pendekat</u> pada persimpangan jalan. |
| W_{AC} (W_{BD}) | LEBAR RATA-RATA PENDEKAT MINOR (UTAMA) (m) | Lebar rata-rata pendekat pada jalan minor (A-C) atau jalan utama (B-C) |
| IT | TIPE SIMPANG | Kode untuk jumlah lengan simpang dan jumlah lajur pada jalan minor dan jalan utama simpang tersebut. |
| | JUMLAH LAJUR | Jumlah lajur, ditentukan dari lebar rata-rata pendekat minor/utama. |
| Q_{TOT} | ARUS TOTAL | Arus kendaraan bermotor total pada persimpangan dinyatakan dalam ken/j, smp/j atau LHRT. |
| Q_{DH} | ARUS JAM RENCANA | Arus lalu-lintas jam puncak untuk perencanaan. |
| Q_{UM} | ARUS KENDARAAN TAK BERMOTOR | Arus kendaraan tak bermotor pada persimpangan. |
| P_{UM} | RASIO KENDARAAN | Rasio antara kendaraan tak bermotor dan kendaraan |

| | | |
|----------|---------------------------|---|
| | TAK BERMOTOR | bermotor pada persimpangan. |
| Q_{MA} | ARUS TOTAL JALAN UTAMA | Jumlah arus total yang masuk dari jalan utama (kend/jam atau smp/jam). |
| Q_{MI} | ARUS TOTAL JALAN MINOR | Jumlah arus total yang masuk dari jalan minor (kend/jalan atau smp/j) |
| P_{MI} | RASIO ARUS JALAN MINOR | Rasio arus jalan minor terhadap arus persimpangan total. |
| D | TUNDAAN | Waktu tempuh tambahan untuk melewati simpang bila dibandingkan dengan situasi tanpa simpang, yang terdiri dari tundaan lalu-lintas dan tundaan geometrik. TUNDAAN LALU-LINTAS (DT) = Waktu menunggu akibat interaksi lalu-lintas dengan lalu-lintas yang berkonflik dan TUNDAAN-GEOMETRIK (DG) Akibat perlambatan dan percepatan lalu-lintas yang terganggu dan yang tidak terganggu. |
| LV% | % KENDARAAN RINGAN | % kendaraan ringan dari seluruh kendaraan bermotor yang masuk ke persimpangan jalan, berdasarkan kend/jam. |
| HV% | % KENDARAAN BERAT | % kendaraan berat dari seluruh kendaraan bermotor yang |

| | | |
|------------------|--|---|
| | | masuk ke persimpangan jalan, berdasarkan kend/jam. |
| MC% | % SEPEDA MOTOR | % sepeda motor dari seluruh kendaraan yang masuk ke persimpangan jalan, berdasarkan kend/jam. |
| F_{smp} | FAKTOR SMP | Faktor konversi arus kendaraan bermotor dari kend/jam menjadi smp/jam. $F_{\text{smp}} = (LV\% + HV\% \times \text{emp}_{\text{HIV}} + MC\% \times \text{emp}_{\text{MC}}) / 100.$ |
| k | FAKTOR LHRT | Faktor konversi dari LHRT menjadi arus lalu-lintas jam puncak. $Q_{\text{kend}} = k \times \text{LHRT}$ (kend/jam). |
| C_0 | KAPASITAS DASAR (smp/jam) | Kapasitas persimpangan jalan total untuk suatu kondisi tertentu yang sudah ditentukan sebelumnya (kondisi dasar). |
| F_w | FAKTOR PENYESUAIAN LEBAR MASUK | Faktor penyesuaian untuk kapasitas dasar sehubungan dengan lebar masuk persimpangan jalan. |
| F_M | FAKTOR PENYESUAIAN TIPE MEDIAN JALAN UTAMA | Faktor penyesuaian untuk kapasitas dasar sehubungan dengan tipe median jalan utama. |
| F_{CS} | FAKTOR | Faktor penyesuaian untuk |

| | | |
|-----------|---|---|
| | PENYESUAIAN UKURAN KOTA | kapasitas dasar sehubungan dengan ukuran kota. |
| F_{RSU} | FAKTOR PENYESUAIAN TIPE LINGKUNGAN JALAN, HAMBATAN SAMPING DAN KENDARAAN TAK BERMOTOR | Faktor penyesuaian kapasitas dasar akibat tipe lingkungan jalan, hambatan samping dan kendaraan tak bermotor. |
| F_{LT} | FAKTOR PENYESUAIAN BELOK KIRI | Faktor penyesuaian kapasitas dasar akibat belok kiri. |
| F_{RT} | FAKTOR PENYESUAIAN BELOK KANAN | Faktor penyesuaian kapasitas dasar akibat belok kanan. |
| F_{MU} | FAKTOR PENYESUAIAN RASIO ARUS JALAN MINOR | Faktor penyesuaian kapasitas dasar akibat rasio arus jalan minor. |

SIMPANG BERSINYAL

| | | |
|-------|--------------------------------|--|
| emp | EKIVALEN MOBIL PENUMPANG | Faktor dari berbagai tipe kendaraan sehubungan dengan keperluan waktu hijau untuk keluar dari antrian apabila dibandingkan dengan sebuah kendaraan ringan (untuk mobil penumpang dan kendaraan ringan yang sasisnya sama, $emp = 1,0$). |
|-------|--------------------------------|--|

| | | |
|-----------------|---------------------------------|---|
| smp | SATUAN MOBIL PENUMPANG | Satuan arus lalu-lintas dari berbagai tipe kendaraan yang diubah menjadi kendaraan ringan (termasuk mobil penumpang) dengan menggunakan Faktor emp. |
| Type O | ARUS BERANGKAT TERLAWAN | Keberangkatan dengan konflik antara gerak belok kanan dan gerak lurus/belok kiri dari bagian pendekat dengan lampu hijau pada fase yang sama. |
| Type P | ARUS BERANGKAT TERLINDUNG | Keberangkatan tanpa konflik antara gerakan lalu-lintas belok kanan dan lurus. |
| LT | BELOK KIRI | Indeks untuk lalu-lintas yang belok kiri. |
| LTOR | BELOK KIRI LANGSUNG | Indeks untuk lalu-lintas belok kiri yang diijinkan lewat pada saat sinyal merah. |
| ST | LURUS | Indeks untuk lalu-lintas yang lurus. |
| RT | BELOK KANAN | Indeks untuk lalu-lintas yang belok kekanan. |
| T | PEMBELOKAN | Indeks untuk lalu-lintas yang berbelok. |
| P _{RT} | RASIO BELOK KANAN | Rasio untuk lalu-lintas yang belok kekanan. |

| | | |
|-----------|---------------------------|---|
| Q | ARUS LALU-LINTAS | Jumlah unsur lalu-lintas yang melalui titik tak terganggu di hulu, pendekat per satuan waktu (sbg. Contoh: kebutuhan lalu-lintas kend./jam; smp/jam). |
| Q_0 | ARUS MELAWAN | Arus lalu-lintas dalam pendekat yang berlawanan yang berangkat dalam fase hijau yang sama. |
| Q_{RTO} | ARUS MELAWAN, BELOK KANAN | Arus dari lalu-lintas belok kanan dari pendekat yang berlawanan (kend./jam; smp/jam). |
| S | ARUS JENUH | Besarnya keberangkatan antrian didalam suatu pendekat selama kondisi yang ditentukan (smp/jam hijau). |
| S_0 | ARUS JENUH DASAR | Besarnya keberangkatan antrian di dalam pendekat selama kondisi ideal (smp/jam hijau). |
| DS | DERAJAT KEJENUHAN | Rasio dari arus lalu-lintas terhadap kapasitas untuk suatu pendekat (Q_{xc}/S_{xg}). |
| FR | RASIO ARUS | Rasio arus terhadap arus jenuh (Q/S) dari suatu pendekat. |
| IFR | RASIO ARUS SIMPANG | Jumlah dari rasio arus kritis (=tertinggi) untuk semua fase sinyal yang berurutan dalam suatu siklus ($IFR = \sum (Q/S)_{CRIT}$). |

| | | |
|----|-----------------------|---|
| PR | RASIOFASE | Rasio arus kritis dibagi dengan rasio arus simpang (sebagai contoh: untuk fase $I:PR=FR/IFR$). |
| C | KAPASITAS | Arus lalu-lintas maksimum yang dapat dipertahankan (sbg contoh: untuk fase $C_j = S_j \times g/c$ kendaraan/jam, smp/jam). |
| F | FAKTOR PENYESUAIAN | Faktor koreksi untuk penyesuaian dari nilai ideal ke nilai sebenarnya dari suatu variable. |
| D | TUNDAAN | <p>Waktu tempuh tambahan yang diperlukan untuk melalui simpang apabila dibandingkan lintasan tanpa melalui suatu simpang.</p> <p>Tundaan terdiri dari TUNDAAN LALU-LINTAS (DT) dan TUNDAAN GEOMETRI (DG). DT adalah waktu menunggu yang disebabkan interaksi lalu-lintas dengan gerakan lalu-lintas yang bertentangan. DG adalah disebabkan oleh perlambatan dan percepatan kendaraan yang membelok di simpangan dan/atau yang terhenti oleh lampu merah.</p> |
| QL | PANJANG | Panjang antrian kendaraan |

| | | |
|-----|--------------------------------|---|
| | ANTRIAN | dalam suatu pendekat (m). |
| NQ | ANTRIAN | Jumlah kendaraan yang antri dalam suatu pendekat (kend. smp). |
| NS | ANGKA HENTI | Jumlah rata-rata berhenti per kendaraan (termasuk berhenti berulang-ulang dalam antrian). |
| Psv | RASIO KENDARAAN TERHENTI | Rasio dari arus lalu-lintas yang terpaksa berhenti sebelum melewati garis henti akibat pengendalian sinyal. |

KONDISI DAN KARAKTERISTIK GEOMETRIK

| | | |
|-------------|----------------|---|
| | PENDEKAT | Daerah dari suatu lengan persimpangan jalan untuk kendaraan mengantri sebelum keluar melewati garis henti. (Bila gerakan lalu-lintas ke kiri atau ke kanan dipisahkan dengan pulau lalu-lintas, sebuah lengan persimpangan jalan dapat mempunyai dua pendekat). |
| W_A | LEBAR PENDEKAT | Lebar dari bagian pendekat yang diperkeras, diukur di bagian tersempit di sebelah hulu (m). |
| W_{MASUK} | LEBAR MASUK | Lebar dari bagian pendekat yang diperkeras, diukur pada garis henti (m). |

| | | |
|---------------------|---------------|---|
| W_{KELUAR} | LEBAR KELUAR | Lebar dari bagian pendekat yang diperkeras, yang digunakan oleh lalu-lintas buangan setelah melewati persimpangan jalan (m). |
| W_E | LEBAR EFEKTIF | Lebar dari bagian pendekat yang diperkeras, yang digunakan dalam perhitungan kapasitas (yaitu dengan pertimbangan terhadap W_A , W_{MASUK} dan W_{KELUAR} dan gerakan lalu-lintas membelok; m). |
| L | JARAK | Panjang dari segmen jalan (m). |
| GRAD | LANDAI JALAN | Kemiringan dari suatu segmen jalan dalam arah perjalanan (+/- %). |

KONDISI LINGKUNGAN

| | | |
|-----|----------------|--|
| COM | KOMERSIAL | Tata guna lahan komersial (sbg. contoh: toko, restoran, kantor) dengan jalan masuk langsung bagi pejalan kaki dan kendaraan. |
| RES | PERMUKIMAN | Tata guna lahan tempat tinggal dengan jalan masuk langsung bagi pejalan kaki dan kendaraan. |
| RA | AKSES TERBATAS | Jalan masuk langsung terbatas atau tidak ada sama sekali (sbg. |

contoh, karena adanya hambatan fisik, jalan samping, dsb).

| | | |
|----|------------------|--|
| CS | UKURAN KOTA | Jumlah penduduk dalam suatu daerah perkotaan. |
| SF | HAMBATAN SAMPING | Interaksi antara arus lalu-lintas dan kegiatan di samping jalan yang menyebabkan pengurangan terhadap arus jenuh didalam pendekatan. |

PARAMETER PENGATURAN SINYAL

| | | |
|------------|----------------------|---|
| i | FASE | Bagian dari siklus sinyal dengan lampu hijau disediakan bagi kombinasi tertentu dari gerakan lalu-lintas (i = indeks untuk nomor fase). |
| c | WAKTU SIKLUS | Waktu untuk urutan lengkap dari indikasi sinyal (sbg. contoh, diantara dua saat permulaan hijau yang berurutan di dalam pendekatan yang sama; det). |
| g | WAKTU HIJAU | Waktu nyala hijau dalam suatu pendekatan (det). |
| g_{\max} | WAKTU HIJAU MAKSIMUM | Waktu hijau maksimum yang di iijinkan dalam suatu fase untuk kendali lalu-lintas aktuasi kendaraan (det). |

| | | |
|-----------|---------------------|--|
| g_{min} | WAKTU HIJAU MINIMUM | Waktu hijau minimum yang diperlukan (sbg. contoh, karena penyeberangan pejalan kaki, det). |
| GR | RASIO HIJAU | Perbandingan antara waktu hijau dan waktu siklus dalam suatu pendekat ($GR = g/c$). |
| ALL-RED | WAKTU MERAH SEMUA | Waktu dimana sinyal merah menyala bersamaan dalam pendekat-pendekat yang dilayani oleh dua fase sinyal yang berurutan (det). |
| AMBER | WAKTU KUNING | Waktu di mana lampu kuning dinyalakan setelah hijau dalam sebuah pendekat (det). |
| IG | ANTAR HIJAU | Periode kuning + merah semua antara dua fase sinyal yang berurutan (det). |
| LTI | WAKTU HILANG | Jumlah semua periode antar hijau dalam siklus yang lengkap (det). Waktu hilang dapat juga diperoleh dari beda antara waktu siklus dengan jumlah waktu hijau dalam semua fase yang berurutan. |

1. Perbaikan Panjang Antrian pada Jl. Rungkut Kidul

a. Alternative 1

- Simpang bersinyal dengan pengaturan 3 fase.
- Hambatan Samping kategori sedang.
- Pelebaran pada W_{MASUK} Jl. Rungkut Kidul sebesar 2 meter.
- Pelebaran pada W_{MASUK} Jl. Rungkut Industri Kidul sebesar 1 meter.

b. Alternative 2

- Perubahan fase.
- Penyesuaian waktu siklus.

c. Alternative 3

- Penambahan 1 lajur pada Jl. Rungkut Kidul untuk W_{LTOR} sebesar 3,5 meter.
- Perubahan arus.
- Penyesuaian waktu siklus.

Untuk memudahkan proses perhitungan, analisa dilakukan sama seperti perhitungan simpang bersinyal pada BAB VI menggunakan bantuan program KAJI. Hasil analisa perbaikan panjang antrian Jl. Rungkut Kidul sebagai berikut :

| Alternatif | Panjang Antrian (m) |
|------------|---------------------|
| 1 | 209 |
| 2 | 148 |
| 3 | 120 |

2. Validasi Panjang Antrian pada Jl. Rungkut Kidul

- a. Pada Rabu, 19 Juli 2017 jam 07.10. Panjang antrian mencapai 360 meter

- b. Pada Rabu, 19 Juli 2017 jam 07.50. Panjang antrian mencapai 286 meter

BIODATA PENULIS

Penulis bernama lengkap Sevy Riski Ariani. Lahir di Surabaya pada tanggal 22 September 1996 merupakan anak sulung dari 3 bersaudara. Penulis telah menempuh pendidikan formal di TK Hang Tuah 11, SDN Margorejo 1 Surabaya, SMPN 12 Surabaya, dan SMAN 16 Surabaya. Setelah selesai menempuh pendidikan SMA, penulis melanjutkan pendidikan di Diploma III Teknik Infrastruktur Sipil-FV-ITS Surabaya pada tahun 2014 dan terdaftar dengan NRP 3114030102. Penulis mengambil konsentrasi Bangunan Transportasi. Penulis mengikuti kerja praktek di Satuan Kerja Pelaksanaan Jalan Nasional Wilayah I Provinsi Jawa Timur pada proyek Preservasi dan Rekonstruksi Jalan Gempol – Pasuruan – Probolinggo. Penulis juga mengikuti berbagai kegiatan kepanitiaan dan organisasi kampus, salah satunya yaitu menjadi Staff Kaderisasi PSDM HMDS periode 2015 – 2016. Selama studi 3 tahun penulis dapat menyelesaikan Tugas Akhir Terapan ini dengan judul Evaluasi Kinerja Simpang Tak Bersinyal Jl. Rungkut Kidul – Jl. Zamhuri – Jl. Rungkut Tengah – Jl. Rungkut Industri Kidul Surabaya.
